

1. Claim Accounting

Claims 1, 5-7, 9-14, 16-19, 21-30, 32-44, 51, 60, 63-65, 68, 74-79, 82, 88-106, 128, 144, 152-153, 155-162, 164-177, 185, 189-200, 202-204, 207-208, 210-228, 230-252, 254-260, 262-290, 292-295, 299, 320-321, 323, 325, 329, 338-339, 341-342, 345, 349, 352, 383, 386-391, 394-396 & 399 are amended. Claims 1-399 are pending in the application. Applicants present no new matter in the foregoing amendments. Applicants respectfully request approval and entry of this amendment.

2. Summary of Office Action Rejections

The Office Action mailed on March 30, 2000 only rejects claims 1-152. However, Applicants' have added claims 153-399 in an amendment on May 8, 2000 in consonance with Applicants' agreement with the PTO to consolidate certain of Applicants' co-pending applications. Therefore, this response considers the rejection of claims 1-152 to apply to all currently pending claims 1-399.

The following summarizes the objections and rejections of the March 30, 2000 Office Action with respect to its corresponding paragraph numbers:

Paragraph 3. Claims 1-399 are rejected under 35 U.S.C. § 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor, at the time the application was filed, had possession of the claimed invention.

Paragraph 4. Claims 1-399 that are directed to digital related processes and apparatus, are rejected under 35 U.S.C. § 112, first paragraph, as containing subject matter which was not described in the specification in such a way to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Paragraph 5. Claims 1-399 that are directed to data, datum, and indicia and related processes and apparatus, are rejected under 35 U.S.C. § 112, first paragraph, as containing subject matter which was not described in the specification in such a way to

enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Paragraph 6. Claims 1-399 are rejected under 35 U.S.C. § 112, first paragraph, because the best mode contemplated by the inventor has not been disclosed.

Paragraph 8. Claims 1-399 are rejected under 35 U.S.C. § 112, second paragraph, as failing to set forth the subject matter which Applicants regard as their invention.

Paragraph 9. Claims 1-399 using the terms having different descriptions from Applicants' 1987 specification and 1981 priority application, are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which Applicants' regard as their invention.

Paragraph 10. Claims 1-399 using the terms, *inter alia*, 'program' and 'programming' are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which Applicants' regard as their invention.

Paragraph 12. Claims 1-399 are rejected under 35 U.S.C. § 102(b) as being clearly anticipated by Applicants' U.S. Pat. Nos. 4,694,490 and 4,704,725.

Paragraph 14. Claims 1-399 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Applicants WO 89/02682.

Paragraph 15. Claims 1-399 that are directed to processes of controlling cable head end processes and monitoring of those processes and combined medium presentation, are rejected under 35 U.S.C. § 103(a) as being unpatentable over Greenberg, U.S. Pat. No. 4,547,804 in view of Galumbeck et al., U.S. Pat. No. 4,725,886.

Paragraph 16. Claims 1-399 that are directed to, *inter alia*, processes of controlling broadcast subscriber stations, including decrypting, processing, storing, generation and monitoring to those processes and combined medium presentation, are rejected under 35 U.S.C. § 103(a) as being unpatentable over Jeffers et al., U.S. Pat. No. 4,739,510.

Paragraph 17. Claims 1-399 that are directed to, *inter alia*, processes of controlling cable head end processes and monitoring of those processes and combined medium presentation are rejected under 35 U.S.C. § 103(a) as being unpatentable over Hazelwood et al., U.S. Pat. No. 4,025,851 in view of the publication "System and Apparatus for Automatic Monitoring Control of Broadcast Circuits" by Yaname et al. and Hetrich, Australian Patent No. 74,619.

Paragraph 18. Claims 1-399 that are directed to, *inter alia*, processes of controlling subscriber station processes and monitoring of those processes and of combined medium presentation and processes, are rejected under 35 U.S.C. § 103(a) as being unpatentable over either one of the common subject matter suggested by Campbell et al., (WO 81/02961, abandoned parent application no. 135,987, and U.S. Pat. No. 4,536,791), in view of at least one or more of: Breeze "Television Line 21 Encoded Information and It's Impact on Receiver Station Design"; Schnee, U.S. Pat. No. 4,290,142; and Zaboklicki, DE 2,904,891.

Paragraph 19. Claims 1-399 that are directed to, *inter alia*, either processes of controlling affiliate stations and processes and monitoring of those processes and combined medium presentation or processes of controlling subscriber stations and method and process for monitoring and providing combined medium presentations, that fall out each particular determining group members of the group of claims described in rejection above, the groups are rejected further in view of one or more of: Hazelwood et al., Yaname et al., Hetrich, Marsden, Young et al., "Journal of SMPTE" Oct. 1971, U.S. Pat. No. 3,761,888 to Flynn, U.S. Pat. No. 3,627,914 to Davis, Tunmann et al., U.K. Pat. No. 959,374 to Germany, Byloff, Chiddix, Skilton, Schiller et al., Zettl, Vikene, U.S. Pat. No. 4,547,804 to Greenberg, Jeffers et al., Diederich, Campbell et al. (WO 81/02961, abandoned U.S. application no. 135,987, and U.S. Pat. No. 4,536,791), Kazama et al., Gosch, Stern, Breeze, Barlow, Millar, U.S. Pat. No. 4,725,886 to Galumbeck et al., "CBS/CCETT North American Broadcast Teletext Specification," Zaboklicki, U.S. Pat.

No. 4,064,490 to Nagel, U.S. Pat. No. 4,251,691 to Kakihara, Hedger et al., Anderson, Gunn, Gaucher, U.S. Pat. No. 4,290,142 to Schnee et al.

Paragraphs 20-21. All claims are subject by the Office to an administrative requirement based on the nonstatutory double patenting rejection based on a judicially created doctrine preventing the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees.

Paragraph 23. All pending claims are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over at least one or more of Applicants' issued patents, U.S. Pat. Nos.: 4,694,490; 4,704,725; 4,965,825; 5,109,414; 5,233,654; and 5,335,277, in view of at least one or more of: Marsden, Young et al., Flynn, Davis, Tunmann et al., Germany, Chiddix, Skilton, Schiller et al., Zettl, Vikene, Greenberg, Jeffers et al., Diederich, Campbell et al., Kazama et al., Gosch, Stern, Breeze, Barlow, Millar, Galumbeck, CBS/CETT North American Broadcast Teletext Specification," Zaboklicki, Nagel, Kakihara, Hedger et al., Anderson, Gunn, Gaucher, and Schnee et al.

Paragraph 24. Rejects Applicants' basis for amending the typographical errors in the instant specification in two places on page 37.

Paragraph 25. The oath or declaration is defective under 37 C.F.R. § 1.67(a).

B. Summary of Claim Amendments

Claims 1, 5-7, 9-14, 16-19, 21-30, 32-44, 51, 60, 63-65, 68, 74-79, 82, 88-106, 128, 144, 152-153, 155-162, 164-177, 185, 189-200, 202-204, 207-208, 210-228, 230-252, 254-260, 262-290, 292-295, 299, 320-321, 323, 325, 329, 338-339, 341-342, 345, 349, 352, 383, 386-391, 394-396 & 399 are amended.

Claim 1 has been amended to correct an antecedent basis problem.

Claim 5 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 6 has been amended to correct an antecedent basis problem.

Claim 7 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 9 has been amended to correct an antecedent basis problem.

Claim 10 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 11 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 12 has been amended to correct an antecedent basis problem.

Claim 13 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 14 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 16 has been amended to correct an antecedent basis problem.

Claim 17 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 18 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 19 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 21 has been amended to correct an antecedent basis problem.

Claim 22 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 23 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 24 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 25 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 26 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 27 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 28 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 29 has been amended to correct an antecedent basis problem.

Claim 30 has been amended to correct an antecedent basis problem.

Claim 32 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 33 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 34 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 35 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 36 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 37 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 38 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 39 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 40 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 41 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 42 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 43 has been amended to correct an antecedent basis problem.

Claim 44 has been amended to correct an antecedent basis problem.

Claim 51 has been amended to correct an antecedent basis problem.

Claim 60 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 63 has been amended to correct an antecedent basis problem.

Claim 64 has been amended to correct an antecedent basis problem.

Claim 65 has been amended to correct an antecedent basis problem.

Claim 68 has been amended to correct an antecedent basis problem.

Claim 74 has been amended to correct an antecedent basis problem.

Claim 75 has been amended to format the claim language.

Claim 76 has been amended to format the claim language.

Claim 77 has been amended to correct an antecedent basis problem.

Claim 78 has been amended to correct an antecedent basis problem.

Claim 79 has been amended to format the claim language.

Claim 82 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 88 has been amended to correct an antecedent basis problem.

Claim 89 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 90 has been amended to correct an antecedent basis problem.

Claim 91 has been amended to correct an antecedent basis problem.

Claim 92 has been amended to correct an antecedent basis problem.

Claim 93 has been amended to correct an antecedent basis problem.

Claim 94 has been amended to correct an antecedent basis problem.

Claim 95 has been amended to correct an antecedent basis problem.

Claim 96 has been amended to correct an antecedent basis problem.

Claim 97 has been amended to correct an antecedent basis problem.

Claim 98 has been amended to correct an antecedent basis problem.

Claim 99 has been amended to correct an antecedent basis problem.

Claim 100 has been amended to format the claim language.

Claim 101 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 102 has been amended to correct an antecedent basis problem.

Claim 103 has been amended to correct an antecedent basis problem.

Claim 104 has been amended to correct an antecedent basis problem.

Claim 105 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 106 has been amended to correct an antecedent basis problem.

Claim 128 has been amended to correct an antecedent basis problem.

Claim 144 has been amended to correct a typographical error.

Claim 152 has been amended to correct an antecedent basis problem.

Claim 153 has been amended to correct an antecedent basis problem.

Claim 155 has been amended to correct an antecedent basis problem.

Claim 156 has been amended to correct an antecedent basis problem.

Claim 157 has been amended to correct an antecedent basis problem.

Claim 158 has been amended to correct an antecedent basis problem.

Claim 159 has been amended to correct an antecedent basis problem.

Claim 160 has been amended to correct an antecedent basis problem.

Claim 161 has been amended to correct an antecedent basis problem.

Claim 162 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 164 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 165 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 166 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 167 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 168 has been amended to correct an antecedent basis problem.

Claim 169 has been amended to correct an antecedent basis problem.

Claim 170 has been amended to correct an antecedent basis problem.

Claim 171 has been amended to correct an antecedent basis problem.

Claim 172 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 173 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 174 has been amended to correct an antecedent basis problem.

Claim 175 has been amended to correct an antecedent basis problem.

Claim 176 has been amended to correct an antecedent basis problem.

Claim 177 has been amended to correct an antecedent basis problem.

Claim 185 has been amended to correct a typographical error.

Claim 189 has been amended to correct an antecedent basis problem.

Claim 190 has been amended to correct an antecedent basis problem.

Claim 191 has been amended to correct an antecedent basis problem.

Claim 192 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 193 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 194 has been amended to correct an antecedent basis problem.

Claim 195 has been amended to correct an antecedent basis problem.

Claim 196 has been amended to correct an antecedent basis problem.

Claim 197 has been amended to correct an antecedent basis problem.

Claim 198 has been amended to correct an antecedent basis problem.

Claim 199 has been amended to correct an antecedent basis problem.

Claim 200 has been amended to correct an antecedent basis problem.

Claim 202 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 203 has been amended to correct an antecedent basis problem.

Claim 204 has been amended to correct an antecedent basis problem.

Claim 207 has been amended to correct an antecedent basis problem.

Claim 208 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 210 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 211 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 212 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 213 has been amended to correct a typographical error.

Claim 214 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 215 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 216 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 217 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 218 has been amended to correct an antecedent basis problem.

Claim 219 has been amended to correct an antecedent basis problem.

Claim 220 has been amended to correct an antecedent basis problem.

Claim 221 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 222 has been amended to correct an antecedent basis problem.

Claim 223 has been amended to correct an antecedent basis problem.

Claim 224 has been amended to correct an antecedent basis problem.

Claim 225 has been amended to correct an antecedent basis problem.

Claim 226 has been amended to correct an antecedent basis problem.

Claim 227 has been amended to correct an antecedent basis problem.

Claim 228 has been amended to correct an antecedent basis problem.

Claim 230 has been amended to correct an antecedent basis problem.

Claim 231 has been amended to correct an antecedent basis problem.

Claim 232 has been amended to correct an antecedent basis problem.

Claim 233 has been amended to correct an antecedent basis problem.

Claim 234 has been amended to correct an antecedent basis problem.

Claim 235 has been amended to correct an antecedent basis problem.

Claim 236 has been amended to correct an antecedent basis problem.

Claim 237 has been amended to correct an antecedent basis problem.

Claim 238 has been amended to correct an antecedent basis problem.

Claim 239 has been amended to correct an antecedent basis problem.

Claim 240 has been amended to correct an antecedent basis problem.

Claim 241 has been amended to correct an antecedent basis problem.

Claim 242 has been amended to correct an antecedent basis problem.

Claim 243 has been amended to correct an antecedent basis problem.

Claim 244 has been amended to correct an antecedent basis problem.

Claim 245 has been amended to correct an antecedent basis problem.

Claim 246 has been amended to correct an antecedent basis problem.

Claim 247 has been amended to correct an antecedent basis problem.

Claim 248 has been amended to correct an antecedent basis problem.

Claim 249 has been amended to correct an antecedent basis problem.

Claim 250 has been amended to correct an antecedent basis problem.

Claim 251 has been amended to correct an antecedent basis problem.

Claim 252 has been amended to correct an antecedent basis problem.

Claim 254 has been amended to format the claim language.

Claim 255 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 256 has been amended to correct an antecedent basis problem.

Claim 257 has been amended to correct an antecedent basis problem.

Claim 258 has been amended to correct an antecedent basis problem.

Claim 259 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 260 has been amended to correct an antecedent basis problem.

Claim 262 has been amended to correct an antecedent basis problem.

Claim 263 has been amended to correct an antecedent basis problem.

Claim 264 has been amended to correct an antecedent basis problem.

Claim 265 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 266 has been amended to correct an antecedent basis problem.

Claim 267 has been amended to correct an antecedent basis problem.

Claim 268 has been amended to correct an antecedent basis problem.

Claim 269 has been amended to correct an antecedent basis problem.

Claim 270 has been amended to correct an antecedent basis problem.

Claim 271 has been amended to correct an antecedent basis problem.

Claim 272 has been amended to correct an antecedent basis problem.

Claim 273 has been amended to correct an antecedent basis problem.

Claim 274 has been amended to correct an antecedent basis problem.

Claim 275 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 276 has been amended to correct an antecedent basis problem.

Claim 277 has been amended to correct an antecedent basis problem.

Claim 278 has been amended to correct an antecedent basis problem.

Claim 279 has been amended to correct an antecedent basis problem.

Claim 280 has been amended to correct an antecedent basis problem.

Claim 281 has been amended to correct an antecedent basis problem.

Claim 282 has been amended to correct an antecedent basis problem.

Claim 283 has been amended to correct an antecedent basis problem.

Claim 284 has been amended to correct an antecedent basis problem.

Claim 285 has been amended to correct an antecedent basis problem.

Claim 286 has been amended to correct an antecedent basis problem.

Claim 287 has been amended to correct an antecedent basis problem.

Claim 288 has been amended to correct an antecedent basis problem.

Claim 289 has been amended to correct an antecedent basis problem.

Claim 290 has been amended to correct an antecedent basis problem.

Claim 292 has been amended to correct an antecedent basis problem.

Claim 293 has been amended to correct an antecedent basis problem.

Claim 294 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 295 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 299 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 320 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 321 has been amended to correct an antecedent basis problem.

Claim 323 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 325 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 329 has been amended to correct a typographical error.

Claim 338 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 339 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 341 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 342 has been amended to correct an antecedent basis problem.

Claim 345 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 349 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 352 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 383 has been amended to format the claim language.

Claim 386 has been amended to correct an antecedent basis problem.

Claim 387 has been amended to format the claim language.

Claim 388 has been amended to correct an antecedent basis problem.

Claim 389 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 390 has been amended to format the claim language.

Claim 391 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 394 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 395 has been amended to further clarify the claim language in view of Applicants' disclosure.

Claim 396 has been amended to correct an antecedent basis problem.

Claim 399 has been amended to format the claim language.

C. Statement of Patentable Novelty under 37 C.F.R. § 1.111

Applicants submit that the independent claims as amended include the following limitations that are not found in the prior art. These limitations show patentable novelty in view of the state of the art disclosed by the references cited and the objections made.

Claim 1:

receiving a plurality of said data units on a multiple channel data stream, at least some of said data units being received sequentially; and

performing the following steps for each of said received data units:

(a) storing the received data units in a data buffer;

(b) decoding the identification portion of the data units to identify the at least one characteristic of the data units;

(c) determining whether the data units should be distributed before or after one or more other of said data units based on the identified at least one characteristic of the data units; and

(d) transmitting the data units in an order relative to other of said data units based on said step of determining.

Claim 5:

receiving said data units in an information stream, said stream having said data units separated in the time domain so that said data units are sequentially received by said switch;

processing said data units by decoding said identification portion of each of said data units to identify priority of said information content portion of said data units;

routing each of said data units to a data port on said switch;

selecting a storage location to store each of said data units; and

communicating each of said data units to said selected storage location to prioritize transmission of each of said data units.

Claim 12:

receiving said data units in an information stream, said stream having said data units separated in the time domain so that said data units are sequentially received by a switch;

processing said data units by decoding said identification portion of each of said data units to identify said information content portion of said data units;

comparing said identification portion of said data units to predetermined timing data to determine a transmission time based on said identification portion of said data units; and

transmitting said data units based on said comparing step.

Claim 17:

receiving said data units in an information stream, said stream having said data units separated in the time domain so that said data units are sequentially received by said switch;

processing said data units by decoding said identification portion of each of said data units to identify said information content portion of said data units;

comparing said decoded identification portion of each of said data units to predetermined priority data to determine a transmission priority;

communicating an instruct-to-delay signal to cause a delay in communication of said data units.

Claim 24:

receiving said data units from a multiple channel data stream, said multiple channel data stream having said data units separated in the time domain so that said data units are sequentially received on a data port on said switch;

processing said data units by decoding said first portion of said data units to identify a type of data in said second multimedia information portion and to identify a specific destination address that indicates routing information for said data units;

assigning a transmission priority to said data units based on said type of data in said second multimedia portion of said data units determined by said step of processing said data units by placing said data units into said data buffer and;

transmitting said data units based on said assigned priority determined by the type of data in said second multimedia information portion of said data units to a data port on said switch.

Claim 33:

receiving said multimedia data at an input on a first switch, said multimedia data having multimedia signal units separated in the time domain so that said multimedia data is sequentially received;

processing said multimedia data units by decoding a first encoded portion of said multimedia data units to determine a destination address for said multimedia data units;

routing said multimedia data units to an output port on said network of switches based on said processing step;

storing said multimedia data units in a temporary storage location based on said routing step that was determined in said processing step;

transmitting said multimedia data units from said temporary storage location at an asynchronous time, said asynchronous time determined by decoding said first encoded portion of said multimedia data units to determine a type of data in said second multimedia information portion to a second switch.

Claim 38:

receiving multimedia data units from a multiple channel data stream, said multiple channel data stream having multimedia data units separated in the time domain so that said multimedia data units have an asynchronous arrival at a data port on said switch;

processing said multimedia data units by decoding said first portion to identify a type of data in said second multimedia information portion and to identify a specific destination address that indicates routing information for said multimedia data units;

storing said multimedia signal in a temporary storage location based on said routing information determined in said processing step;

processing said multimedia data units by decoding said second multimedia information portion of said multimedia data units and re-formatting said multimedia data units from said second multimedia information portion of said multimedia data units;

re-timing said re-formatted multimedia data units into a synchronous data stream.

Claim 51:

inputting and storing a command, said command designating at least one of:

(1) a signal to be stored, said signal including at least one of television, radio, video, audio, data, and computer programming;

(2) a time to communicate a signal; and

(3) a place to communicate a signal to or from, said place including at least one of a transmitter, video monitor, a speaker, a computer, a processor, a controller, a storage device, and a subscriber station;

receiving said signal;

storing said signal at a first storage location, said first storage location being capable of being commanded to store and output said signal; and

outputting said signal from said first storage location to a second storage location in accordance with said command;

storing said signal at said second storage location, said second storage location being capable of being commanded to store and output said signal; and

communicating said signal from said second storage location.

Claim 52:

receiving an information transmission including programming comprising at least one of television, radio, video, audio, data, and computer programming;

demodulating said information transmission;

detecting said programming embedded in said information transmission;

storing said programming at a first storage location;

transferring said programming stored at said first location to a second location in response to a command;

storing said programming at said second storage location to enable said receiver station to transfer said programming from said second storage location to a computer at a specific time or in response to said command.

Claim 59:

storing television programming at a first storage location, said television programming, including video and audio;

transferring, under computer control, said television programming from said first storage location to a second storage location at a selected one of said at least one intermediate station;

storing said television programming at said second storage location to enable said selected intermediate station to communicate said television programming from said second storage location to a selected one of said at least one subscriber station;

communicating a programming identification signal from said origination station to said selected intermediate station, said programming identification signal identifying said television programming stored at said second storage location;

detecting, at said selected intermediate station, said programming identification signal communicated from said origination station; and

communicating said television programming from said second storage location to said selected subscriber station based on said programming identification signal.

Claim 60:

storing television programming at a first storage location at a first intermediate station, said first intermediate station being one of said plurality of intermediate stations in said network;

transferring, under computer control, said television programming from said first storage location to a second storage location at a second intermediate station, said second intermediate station being one of said plurality of intermediate stations in said network;

storing said television programming at said second storage location to enable communication of said television programming from said second intermediate station to at least one of said plurality of subscriber stations.

Claim 66:

receiving one of a broadcast and cablecast transmission;

demodulating said one of a broadcast and cablecast transmission, said one of a broadcast and cablecast transmission including an embedded signal;

detecting said embedded signal on said one of a broadcast and cablecast transmission;

selecting information stored at a first storage location in response to said embedded signal;

transferring said information from said first storage location to a second storage location based on said embedded signal, thereby providing a computer access to said information; said first storage location and said second storage location being capable of being commanded to store and output programming.

Claim 68:

inputting schedule information that specifies said television programming, and at least one of:

- (a) a time to communicate said television programming; and
- (b) a place to communicate said television programming to;

transferring said television programming from said first storage location to said second storage location thereby enabling said transmission station to communicate said television programming from said second storage location to a receiver station in accordance with said schedule information.

Claim 72:

a receiver for receiving an information transmission, said information transmission including said programming;

a first storage device connected to said receiver for storing said programming;

a second storage device connected to said first storage device, said second storage device storing said programming output by said first storage device;

a switch connected to said first storage device and said second storage device;

a computer connected to said first storage device, said second storage device, and said switch for controlling said first storage device to output said programming to said second storage device and controlling said second storage device to output said programming to said switch, said computer being capable of:

- (1) selecting a storage device to store said programming;
- (2) commanding said switch to transfer said programming to said selected storage device; and
- (3) commanding said selected storage device to store said programming; and

a cable network connected to said switch for receiving said programming output from said second storage device and communicating said programming to a plurality of subscriber stations.

Claim 74:

a first storage device for storing said television programming;

a second storage device for storing said television programming;

a configurable switch connecting said first storage device to said second storage device;

a modulator connected to said second storage device for communicating said television programming to subscribers; and

a computer connected to said first storage device, said second storage device, and said configurable switch, said computer having a memory and being programmed to perform the following steps:

(a) receiving and storing a programming schedule, said programming schedule designating said television programming, a time to communicate said television programming, and one of a communication channel and frequency for communicating said television programming;

(b) controlling said first storage device to receive and store said television programming;

(c) controlling said configurable switch and said first storage device to transfer said television programming from said first storage device to said second storage device;

(d) controlling said second storage device to store said television programming; and

(e) controlling said second storage device and said modulator to communicate said television programming from said second storage device to said subscribers according to said programming schedule.

Claim 75:

inputting an instruct signal which is effective at said subscriber station to output a signal from a first storage location and store said signal at a second storage location;

detecting the presence of an instruction associated with said instruct signal, said instruction being effective at said subscriber station to generate subscriber station specific data and to select and assemble said subscriber station specific data into a record;

processing at said subscriber station inputted data and performing, in response to said instruction, one of:

(a) generating subscriber station specific data and communicating said subscriber station specific data to a transmitter; and

(b) selecting and assembling into said record said subscriber station specific data and communicating said record to a transmitter; and

transmitting said record to said at least one remote collection station.

Claim 76:

identifying at least one of a device and a control signal which operates to output a signal from a first storage location and store said signal at a second storage location;

monitoring said at least one of a device and a control signal;

storing a record of the use of said at least one of a device and a control signal; and

communicating said information from said record from said receiver station to said remote station.

Claim 77:

receiving at said at least one origination transmitter station said data to be transmitted by said at least one remote intermediate transmitter station and delivering said data to at least one origination transmitter, said data comprising an instruct signal which is effective in said network to output a signal from a first storage location and store said signal at a second storage location;

receiving said control signal which operates at said at least one remote intermediate transmitter station to control the communication of said data; and

transmitting said control signal to said at least one origination transmitter before a specific time.

Claim 78:

receiving a first code at a transmitter station, wherein said first code designates one of a product or service offered in a mass medium program and a viewer reaction to an offer communicated in a mass medium program;

receiving a second code at said transmitter station, wherein said second code operates at said plurality of receiver stations to output a signal from a first storage location and store said signal at a second storage location;

transferring said first code and said second code to a transmitter at said transmitter station; and

transmitting said first code and said second code.

Claim 79:

receiving data to be transmitted and delivering said data to a transmitter;

receiving an instruct signal which operates at at least one of said plurality of receiver stations to output a signal from a first storage location and store said signal at a second storage location;

transferring said instruct signal to said transmitter; and

transmitting an information transmission comprising said data and said instruct signal.

Claim 80:

outputting a mass medium program that promotes data, said interactive mass medium program output apparatus having an input device to receive input from a subscriber;

prompting said subscriber during said mass medium program whether said subscriber wants said data promoted in said step of outputting, said interactive mass medium program output apparatus having a memory for storing code;

receiving a reply from said subscriber at said input device in response to said step of prompting, said interactive mass medium program output apparatus having a processor for processing said subscriber reply and said data;

processing said reply and selecting code designating said data, said interactive mass medium program output apparatus having a transmitter for communicating information to a remote station;

communicating said selected code to said remote station, said interactive mass medium output apparatus and said remote station comprising a network having a plurality of transmitter stations;

assembling, in said network, a signal which is effective at said interactive mass medium program output apparatus to store said data at said memory, said interactive mass medium program output apparatus having a receiver for receiving at least a portion of said signal from said remote station;

delivering at least a portion of said signal at said interactive mass medium program output apparatus; and

delivering said data on the basis of said signal.

Claim 84:

detecting one of the presence and absence of a first control signal;
inputting an instruct-to-react signal to said processor based on said step of detecting;
controlling said processor to perform a second function and to output information in response to said step of inputting; and
selecting data and generating a second control signal based on said step of controlling, said second control signal being effective to communicate said selected data to a storage device on the basis of said information.

Claim 88:

inputting said identification information that identifies said television programming;
inputting said television programming to said storage device;
storing said television programming at a selected one of said at least two storage locations; and
storing said identification information with said television programming at said selected location; and
identifying said television programming on the basis of identification information associated in storage with said television programming.

Claim 90:

inputting identification information that specifies a unit of said television programming;
inputting said unit of said television programming associated with said inputted identification information;
identifying said unit of said television programming;

storing said unit at said first storage location; and
storing said identification information at said second storage location, thereby to enable said station to identify said unit stored in the first storage location on the basis of identification information stored in said second storage location.

Claim 91:

inputting schedule information that identifies one of a category and a unit of said television programming;

inputting said television transmission;

locating identification information in said transmission that identifies said one of a category and a unit of said television programming;

storing said television transmission at a first storage device;

determining that said identification information identifies said one of said category and a unit of said television programming;

transferring information of said television programming transmission to a second storage device; and

storing said information of said television programming at said second storage device, thereby enabling said station to broadcast and/or cablecast television programming of said one of a category and a unit of said television programming.

Claim 100:

inputting an instruct signal which is effective at said subscriber station to select and control communication of a datum which identifies information contained in a program;

detecting the presence of at least one of an instruction, code and datum, associated with said instruct signal, which is effective at the subscriber station to one of generate

subscriber station specific data and to select and assemble a plurality of specific and subscriber station specific data into a record;

processing at the subscriber station inputted data and performing, in response to said detected instruction, one of:

(a) generating said subscriber station specific data and communicating said generated subscriber station specific data to a transmitter; and

(b) selecting and assembling into said record a specific plurality of said subscriber specific data and communicating said record and said selected specific plurality of said subscriber specific data to a transmitter; and

transmitting one of said communicated generated subscriber station specific data and said communicated record and specific plurality of said subscriber specific data to said at least one remote collection station.

Claim 101:

receiving information transmissions;

detecting a plurality of signals in at least one of said information transmissions, at least one of said detected plurality of instruct signals being effective at said receiver station to instruct;

passing each of said detected instruct signals to a computer;

controlling said computer on the basis of each of said detected and passed instruct signals;

selecting and controlling communication, under computer control and in response to at least a first of said detected and passed instruct signals, of a datum that identifies information contained in a program; and

storing information evidencing the passing of at least a second of said detected and passed instruct signals.

Claim 103:

receiving mass medium programming to be transmitted by said remote intermediate mass medium transmitter station and delivering said mass medium programming to a transmitter;

receiving at least one instruct signal at said remote intermediate mass medium transmitter station, wherein said at least one instruct signal operates at said remote receiver station to select and control communication of a datum which identifies information contained in said mass medium programming, and communicating said at least one instruct signal to said transmitter;

receiving at least one control signal at said remote intermediate mass medium transmitter station, said at least one control signal operates at said remote intermediate mass medium transmitter station to control communication of one of said mass medium programming and said at least one instruct signal; and

transmitting from said remote intermediate mass medium transmitter section an information transmission comprising said mass medium programming and said at least one instruct signal, said mass medium programming and said at least one instruct signal transmitted in accordance with said at least one control signal.

Claim 104:

receiving a mass medium program at said remote transmitter station and delivering said mass medium program to a transmitter;

receiving at said remote transmitter station at least one instruct signal which operates to select and control communication of one of a code and datum which identifies information contained in said mass medium program;

receiving a control signal which operates at said remote transmitter station to control communication of at least one instruct signal and communicating said control signal to said remote transmitter station;

receiving said one of a code and a datum designating a specific instruct signal of said at least one instruct signal to be transmitted by said remote transmitter station, and said remote transmitter station transferring said designated specific instruct signal to a transmitter; and

transmitting from said remote transmitter station an information transmission comprising said mass medium program and said designated specific instruct signal, said designated specific instruct signal being transmitted at one of specific times and on specific channels.

Claim 105:

receiving at least one of a code and a datum at a transmitter station, wherein said one of a code and a datum designates at least one of a product and a service offered in said television program and said subscriber reaction;

receiving said at least one control signal at said transmitter station, said at least one control signal at said at least one of said plurality of receiver stations operates to select and control communication of information at least one of received with and to be associated with said television program;

transferring at least one of (i) said at least one of a code and a datum and (ii) said at least one control signal to a transmitter at said transmitter station at a specific time; and

transmitting (i) said at least one of a code and a datum and (ii) said at least one control signal from said transmitter station.

Claim 106:

receiving a television program at a transmitter station and delivering said television program to a transmitter;

receiving said at least one instruct signal at said transmitter station, said at least one instruct signal at said at least one receiver station operates to select and control

communication of a datum which identifies information contained in said television program;

transferring said at least one instruct signal from said transmitter station to a transmitter; and

transmitting said television program and said at least one instruct signal from said transmitter station to said at least one receiver station.

Claim 107:

transmitting from said origination stations said programming, said programming including at least one signal for comparison; transmitting at least one retransmission control signal from said origination stations;

said intermediate transmission station receiving said programming; detecting and passing to said automatic control unit said at least one retransmission control signal; and

said automatic control unit performing the step of selectively transferring said programming to said transmitter in accordance with said at least one retransmission control signal.

Claim 108:

receiving said signal outside said network, said signal having at least one first instruction which is operative in said network to output said signal from a first storage location and store said signal at a second storage location;

receiving at least one second instruction outside said network, said at least one second instruction operative at said remote intermediate transmitter station to control communication of said signal; and

transmitting said signal and said at least one second instruction to said network before a specific time.

Claim 130:

programming said remote intermediate transmitter station to control communication of and deliver said at least one signal at said at least one intermediate transmitter in response to at least one detected instruction;

programming said remote intermediate transmitter station to detect said at least one first instruction and said at least one second instruction; and

programming said network to detect and respond to an instruction which is operative in said network to output said at least one signal from a first storage location and store said at least one signal at a second storage location before a specific time.

Claim 152:

receiving said data outside said network, said data including an instruct signal which is effective in said network to output said data from a first storage location and store said data at a second storage location;

receiving said at least one control signal outside said network, said at least one control signal operative at said remote intermediate transmitter station to control communication of said data; and

transmitting said at least one control signal to said network before a specific time.

Claim 153:

receiving an information transmission;

detecting embedded data on said information transmission;

selecting a specific datum of said detected data; and

storing said selected datum at a storage location of a storage device that is not communicating or outputting data to said television monitor, said step of storing enabling said storage device to communicate or output said selected datum to a processor in

response to a control signal and said television monitor to display in television programming at a selected time processed information of said selected datum.

Claim 178:

receiving a carrier transmission;

demodulating said carrier transmission to detect an information transmission thereon, said information transmission comprising embedded data and at least one control signal;

detecting said embedded data and said at least one control signal on said information transmission;

selecting at least one datum of said detected embedded data; and

storing said selected at least one datum at a storage location of a storage device that is not communicating or outputting said detected embedded data to said television monitor;

processing said at least one datum in response to said at least one control signal; and

outputting processed information of said at least one datum to a subscriber.

Claim 180:

receiving a television or radio signal;

demodulating said received signal to detect an information transmission thereon, said information transmission comprising radio or television programming and embedded data;

detecting said embedded data in said information transmission;

selecting a specific datum of said detected data;

storing said selected datum;

processing said at least one datum; and
outputting a control signal containing processed information of said at least one datum.

Claim 188:

receiving a television or radio signal;
demodulating said received signal to detect an information transmission thereon, said information transmission containing radio or television programming, embedded data, and at least a first control signal;
detecting said embedded data in said information transmission, said embedded data comprising at least identification information identifying programming;
selecting one of said plurality of storage locations;
storing said received television or radio signal.

Claim 192:

receiving a television or radio signal;
demodulating said received signal to detect an information transmission thereon, said information transmission comprising a programming unit of radio or television programming and embedded data;
detecting said embedded data in said information transmission;
selecting a storage location;
storing said programming unit and said embedded data in said selected storage location in response to said step of detecting said embedded data.

Claim 201:

receiving a television or radio signal;

demodulating said received signal to detect an information transmission thereon, said information transmission comprising a unit of radio or television programming and embedded data;

detecting said embedded data in said information transmission;

determining, based on said embedded data, whether said received unit of programming should be stored or is designated for delayed communication;

performing the following steps if said received unit of programming should be stored or is designated for delayed communication:

- (a) selecting a storage location; and
- (b) storing said programming unit and its embedded data in the selected storage location.

Claim 202:

receiving a multichannel transmission, each received channel transmission of said multichannel transmission comprising information and an identification signal identifying said information or a source of said information;

scanning a plurality of channels of said multichannel transmission for a predetermined identification signal that identifies information of interest;

detecting said predetermined identification signal on one of said plurality of channels;

identifying a channel of said detected predetermined identification signal;

tuning to said identified channel to receive said information of interest based on said step of identifying;

receiving said information of interest; and

storing said received information of interest.

Claim 205:

a receiver for receiving and demodulating a carrier transmission, said carrier transmission comprising embedded data;

a detector operatively connected to said receiver for detecting the embedded data in the carrier transmission;

a storage device having a plurality of storage locations;

a television monitor; and

a computer operatively connected to said receiver, said detector, said storage device and said monitor, said computer programmed to perform the following steps:

(a) selecting a datum of the detected data;

(b) identifying the datum;

(c) storing the selected datum in the storage device with an identification signal identifying the datum to enable the subsequent identification of the datum based on the identification signal;

(d) receiving information from the detector indicating that the detector has received a control signal, and performing the following steps (e)-(g) in response to said step (d);

(e) identifying the stored selected datum based on the stored identification signal;

(f) processing the selected datum; and

(g) displaying the processed datum on the television monitor.

Claim 206:

storing data at said remote data source;

receiving at said remote data source a query from said receiver station;

transmitting said data from said remote data source to said receiver station in response to said step of receiving said query, said receiver station selecting and storing some of said transmitted data;

transmitting from a second remote source to said receiver station a signal which controls said receiver station to select and process an instruct signal which is effective at said receiver station to output a stored datum for processing and use with a video image.

Claim 207:

receiving a broadcast or cablecast information transmission including a first instruct signal which is effective to store a datum for subsequent processing and use with a video image;

storing user data of interest in response to said first instruct signal;

receiving mass medium programming from a programming source and outputting said mass medium programming at said output device;

detecting a second instruct signal and passing said detected second instruct signal to said computer; and

controlling said computer based on said detected second instruct signal, said step of controlling comprising:

- (1) selecting a specific portion of said stored user data of interest;
- (2) communicating said selected specific portion of said stored user data of interest to said output device; and subsequently
- (3) ceasing to communicate said selected specific portion to said output device;
- (4) delivering at said output device said combined or sequential output of said received mass medium programming and said selected specific portion of said stored user data of interest in the period of time between said step of communicating said selected specific portion to said output device and said step of ceasing to communicate said selected specific portion to said output device.

Claim 208:

receiving code or datum at a transmitter station, said code or datum designates (i) a product or service offered in said television program or (ii) said subscriber reaction;

receiving one or more control signals at said transmitter station, said one or more control signals at said one or more receiver stations operate to store said code or datum for subsequent processing and use with a video image;

transferring said code or datum or said one or more control signals to a transmitter at said transmitter station at a specific time; and

transmitting said code or datum and said one or more control signal from said transmitter station.

Claim 209:

receiving a television signal containing television programming and communicating said television signal to a storage device;

receiving an instruct signal which is to be effective to select and store a datum for processing and use with said television signal;

selecting one of:

- (1) a time at which to communicate said instruct signal; and
- (2) a location to which to communicate said first instruct signal;

communicating said instruct signal at said selected time or to said selected location; and

storing said television signal and said instruct signal at said storage device, wherein said method processes signals to control said subsequent presentation of said television programming.

Claim 210:

receiving data to be transmitted and delivering said data to a transmitter;

receiving one or more instruct signals which at said one or more receiver stations are effective to store a datum for subsequent processing and use with a video image;
transferring said one or more instruct signals to a transmitter; and
transmitting an information transmission comprising said data and said one or more instruct signals.

Claim 211:

outputting a mass medium program that promotes data, said interactive mass medium program output apparatus having an input device to receive input from a subscriber;

prompting said subscriber during said mass medium program whether said subscriber wants said data promoted in said step of displaying, said interactive mass medium program output apparatus having an output device for outputting said data;

receiving a reply from said subscriber at said input device in response to said step of prompting said subscriber, said interactive mass medium program output apparatus having a processor for processing said subscriber reply and controlling delivery of said data in response to instructions;

delivering instructions at said interactive mass medium program output apparatus in response to said step of receiving a reply, said instructions controlling said interactive mass medium program output apparatus;

processing said instructions from said step of delivering, said instructions effective to receive and store said data; and

delivering said data on the basis of said instructions.

Claim 214:

receiving first data and first television programming, said first television programming including audio , said first television programming to be outputted for a

duration of time, only a portion of said duration containing at least a first time interval of specific relevance, at least a first of said first data and said first television programming being received from at least a first remote transmitter station;

delivering at least said audio to said at least one output device for output to a user;

detecting said first data before a first time period during which user specific information will be processed;

delivering said first data to said computer;

generating second data to serve as a basis for delivering said user specific programming by processing at least a first of said first data in said first time period;

selecting third data based on said step of generating said second data;

communicating at least a first of said third data to said at least one output devices before the end of said first time interval of specific relevance; and

outputting said user specific programming, said user specific programming including at least said audio and said at least a first of said third data.

Claim 215:

receiving one or more of (i) said first data, and (ii) television programming at one or more transmitter stations, said television programming to be outputted for a duration of time, only a portion of said duration containing a time interval of specific relevance;

transferring said one or more of (i) said first data, and (ii) television programming to one or more transmitters at a specific time; and

transmitting from said one or more transmitter stations one or more information transmissions comprising said one or more of (i) said first data, and (ii) television programming.

Claim 216:

receiving one or more of (i) said first data, and (ii) television programming at one or more transmitter stations, said television programming to be outputted for a duration of time, only a portion of said duration containing a time interval of specific relevance;

receiving a control signal which operates at said one or more transmitter stations to communicate said one or more of (i) said first data, and (ii) television programming to one or more transmitters to a transmitter; and

transmitting from said one or more transmitter stations one or more information transmissions comprising said one or more of (i) said first data, and (ii) television programming.

Claim 217:

receiving one or more information transmissions containing first data and first television programming, said first television programming to be outputted for a duration of time, only a portion of said duration containing at least a first time interval of specific relevance, at least one of said first data and said first television programming being received from at least a first remote transmitter station;

selecting and delivering said first television programming to said at least one output device for output to said user;

detecting said first data before a first time period during which user specific information will be processed and delivering said first data to said computer;

generating second data to serve as a basis for delivering said user specific programming by processing at least one of said first data in said first time period;

communicating said second data to said at least one output device before the end of said first time interval of specific relevance based on said step of generating second data; and

outputting said user specific programming, said user specific programming comprising said first television programming and said second data.

Claim 218:

inputting at least one control instruction, said at least one control instruction controlling at least one of processing and communication of at least one of television, radio, video, audio, data, multimedia, and computer programming, wherein said at least one control instruction includes at least one of:

(a) a switch control instruction to control operation of a switch to control routing and communication of said at least one of television, radio, video, audio, data, multimedia, and computer programming;

(b) a timing control instruction to control at least one of timing and time of communication of said at least one of television, radio, video, audio, data, multimedia, and computer programming; and

(c) a locating control instruction to at least one of control and allow said computer to at least one of locate and identify said at least one of television, radio, video, audio, data, multimedia, and computer programming;

receiving said at least one of television, radio, video, audio, data, multimedia, and computer programming, wherein said inputted at least one control instruction provides at least one of instruction and information as to processing of said received at least one of television, radio, video, audio, data, multimedia, and computer programming;

storing said received at least one of television, radio, video, audio, data, multimedia, and computer programming; and

storing said at least one control instruction with said at least one of television, radio, video, audio, data, multimedia, and computer programming to enable said computer to subsequently at least one of communicate and process said at least one of television, radio, video, audio, data, multimedia, and computer programming in accordance with said at least one control instruction.

Claim 221:

inputting at least one of television, radio, video, audio, data, multimedia, and computer programming;

storing said inputted at least one of television, radio, video, audio, data, multimedia, and computer programming at one of said plurality of storage locations;

receiving a carrier transmission;

demodulating said carrier transmission to detect an information transmission thereon, said information transmission including at least one control instruction, wherein said at least one control instruction includes one of:

- (a) a switch control instruction;
- (b) a timing control instruction; and
- (c) a locating control instruction;

detecting said at least one control instruction on said information transmission, said at least one control instruction providing information as to processing of said stored at least one of television, radio, video, audio, data, multimedia, and computer programming;

storing said at least one control instruction at said one of said plurality of storage locations with said stored at least one of television, radio, video, audio, data, multimedia, and computer programming enabling said computer to at least one of locate, process, and communicate said at least one of television, radio, video, audio, data, multimedia, and computer programming at a specific time or in a specific manner in accordance with said at least one control instruction.

Claim 223:

inputting and storing at least one control instruction including at least one of:

- (1) an instruction to contact a remote telephone unit;
- (2) an instruction to look for a signal in a predetermined fashion;

- (3) an instruction to erase information in a recorder;
- (4) an instruction to decrypt a signal in a specific fashion;
- (5) an instruction to identify a signal;
- (6) an instruction to pass a signal externally;
- (7) an instruction to identify where to pass a signal;
- (8) an instruction to discard a signal;
- (9) an instruction to mark a signal;
- (10) an instruction to assemble a signal string;
- (11) an instruction to configure a switch;
- (12) an instruction to transfer a signal;
- (13) an instruction to store a signal;
- (14) an instruction to remove a signal;
- (15) an instruction to add a signal;
- (16) an instruction to decrypt a signal;
- (17) an instruction not to decrypt a signal;
- (18) an instruction to interrupt a signal;
- (19) an instruction not to interrupt a signal;
- (20) an instruction informing how to decrypt a signal;
- (21) an instruction informing how to interrupt a signal;
- (22) an instruction to turn on an apparatus;
- (23) an instruction to tune an apparatus;
- (24) an instruction to hold a signal;
- (25) an instruction to monitor a signal;
- (26) an instruction to present a signal;
- (27) an instruction to coordinate a signal;
- (28) an instruction to generate a signal;
- (29) an instruction to transmit a signal upon command;

- (30) an instruction to transmit a specific signal;
- (31) an instruction to overlay a signal;
- (32) an instruction to process if a signal is held;

receiving at least one of a television transmission, a radio transmission, a telephone transmission, and a data transmission, wherein said at least one of a television transmission, a radio transmission, a telephone transmission, and a data transmission includes an information code and one of said at least one control instruction;

detecting said information code and said one of said at least one control instruction in said at least one of a television transmission, a radio transmission, a telephone transmission, and a data transmission, said information code designating at least one of:

- (1) said programming;
- (2) use of said programming;
- (3) a transmitter station;
- (4) said receiver station ;
- (5) a network;
- (6) a broadcast station;
- (7) at least one of a channel on a cable system;
- (8) a time of transmission;
- (9) a unique identifier datum;
- (10) at least one of a source of data and a supplier of data;
- (11) at least one of a distributor and an advertisement;

storing said detected information code and said detected at least one control instruction together at a storage location to enable a computer at said receiver station to identify and at least one of communicate and process said programming in accordance with said information code and said at least one control instruction.

Claim 224:

receiving at least one of television programming and radio programming;
selecting one of a plurality of storage locations;
storing said at least one of television programming and radio programming at said selected one of said plurality of storage locations;
storing an identification signal identifying said at least one of television programming and radio programming with said at least one of television programming and radio programming at said selected one of said plurality of storage locations;
decoding said stored identification signal;
identifying said selected one of said plurality of storage locations that is storing said at least one of television programming and radio programming based on said step of decoding said stored identification signal; and
communicating said at least one of television programming and radio programming from said selected one of said plurality of storage locations to a subscriber based on said step of identifying.

Claim 238:

receiving at least one of television programming and radio programming;
selecting one of a plurality of storage locations;
storing said at least one of television programming and radio programming at said selected one of said plurality of storage locations;
storing information identifying said selected one of said plurality of storage locations that is storing said at least one of television programming and radio programming;
decoding said stored information;

identifying said selected one of said plurality of storage locations that is storing said at least one of television programming and radio programming based on said step of decoding said stored information; and

communicating said at least one of television programming and radio programming from said selected one of said plurality of storage locations to a subscriber in response to said step of identifying.

Claim 242:

receiving at least one of television programming and radio programming with an identification signal;

embedding said identification signal in said received at least one of television programming and radio programming;

selecting one of a plurality of storage locations;

storing said at least one of television programming and radio programming with said embedded identification signal at said selected one of said plurality of storage locations;

receiving and storing a programming schedule designating when and on what channel or frequency said at least one of television programming and radio programming should be communicated to a subscriber;

decoding said stored identification signal;

identifying said selected one of said plurality of storage locations that is storing said at least one of television programming and radio programming based on said step of decoding said stored identification signal;

configuring a switch to allow communication of said at least one of television programming and radio programming from said selected one of said plurality of storage locations to the subscriber according to said programming schedule; and

communicating said at least one of television programming and radio programming from said selected one of said plurality of storage locations to the subscriber via said switch according to said programming schedule.

Claim 244:

a programming storage device for storing at least one of radio programming and television programming;

an input device for inputting said at least one of radio programming and television programming;

a signal detector operatively connected to said programming storage device for detecting signals stored in said programming storage device;

a communicator, operatively connected to said programming storage device, for communicating said at least one of radio programming and television programming and other information to a subscriber;

a computer operatively connected to said input device, said signal detector and said communicator, wherein said computer is programmed to perform the following steps:

(a) receiving said at least one of radio programming and television programming from said input device;

(b) receiving information identifying said received at least one of radio programming and s television programming;

(c) selecting one of a plurality of storage locations on said programming storage device;

(d) outputting said received at least one of radio programming and television programming to said programming storage device and controlling said programming storage device to store said outputted at least one of radio programming and television programming at said selected storage location of said programming storage device;

- (e) outputting the information identifying said at least one of radio programming and television programming to said programming storage device and controlling said programming storage device to store the information with said stored at least one of radio programming and television programming at said selected storage location;
- (f) causing said signal detector to detect the identifying information stored on said programming storage device;
- (g) determining said selected storage location of said stored at least one of radio programming and television programming based on said step (f);
- (h) controlling said programming storage device to output said stored at least one of radio programming and television programming from said selected storage location to said communicator; and
- (i) controlling said communicator to communicate said at least one of radio programming and television programming to said subscriber.

Claim 254:

receiving, at a transmitter station, at least a portion of said downloadable code which is effective to store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming, wherein said downloadable code has a target processor to process data at each of said plurality of receiver stations;

transferring said downloadable code to a transmitter;

receiving said at least one control signal at said transmitter station, wherein said at least one control signal operates to execute said downloadable code; and

transferring said at least one control signal from said transmitter station to said transmitter, and transmitting at least one information transmission including said downloadable code and said at least one control signal.

Claim 255:

inputting a subscriber reaction at a subscriber station;
receiving, at said subscriber station, information that designates at least one of:
(a) said at least one instruct signal to process; and
(b) an output to deliver in consequence of said inputted subscriber reaction;
determining the presence of said inputted subscriber reaction at said subscriber station by processing said inputted subscriber reaction;

processing said at least one instruct signal which is effective to store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming at said subscriber station in consequence of said step of determining; and

transferring, from said subscriber station to said at least one remote data collection station, at least one datum that confirms at least one of:

- (a) delivery of said at least one instruct signal from said step of processing;
and
(b) delivery of said effect from said step of processing.

Claim 256:

identifying said at least one of a resource and a control signal which is effective to store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming;

monitoring said at least one of a resource and a control signal;
storing a record of use of said at least one of a resource and a control signal from said step of monitoring; and
communicating information on said use of said at least one of a resource and a control signal from said step of storing a record from said receiver station to a remote station.

Claim 257:

receiving said at least one instruct signal to be transmitted by said remote intermediate data transmitter station and delivering said at least one instruct signal to said at least one origination transmitter, wherein said at least one instruct signal is effective in said network to store at least one control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming;

receiving said at least one control signal which at the remote intermediate data transmitter station operates to control communication of said at least one instruct signal; and

transmitting said at least one control signal from said at least one origination transmitter before a specific time.

Claim 258:

receiving, at said remote transmitter station, at least one instruct signal which operates at the receiver station to:

(a) store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio

programming, data programming, multimedia programming, and computer programming;
and

(b) at least one of assemble and communicate said at least one receiver
specific datum to said remote data collection station;

receiving at least one control signal which operates at said remote transmitter
station to control communication of said at least one instruct signal and communicating
said at least one control signal to said remote transmitter station;

receiving at least one of a code and a datum designating a specific one of said at
least one instruct signal to be transmitted by said remote transmitter station, and wherein
said transmitter station transfers said designated specific one of said at least one instruct
signal to a transmitter; and

transmitting from said remote transmitter station an information transmission
including at least one designated instruct signal, wherein said at least one designated
instruct signal is transmitted at at least one specific time or on at least one specific
channel in accordance with said at least one control signal.

Claim 259:

receiving said mass medium programming at said receiver station from a mass
medium programming source and outputting said mass medium programming at said at
least one output device, said at least one output device adapted to output said mass
medium programming;

receiving one of a broadcast information transmission and a cablecast information
transmission at said receiver station, wherein said one of a broadcast information
transmission and a cablecast information transmission includes at least one instruct signal
to direct said at least one output device to at least one of complete and supplement said
mass medium programming;

detecting said at least one instruct signal in said one of a broadcast information transmission and a cablecast information transmission and passing said detected at least one instruct signal to a processor; and

controlling said processor based on said detected at least one instruct signal, said step of controlling further comprising the steps of:

(a) storing a control instruction for subsequent processing and use to at least one of complete and supplement said mass medium programming; and

(b) directing said output to at least one of complete and supplement said mass medium programming to said at least one output device in consequence of said control instruction.

Claim 260:

receiving at least one instruct signal at a transmitter station and delivering said at least one instruct signal to a transmitter, wherein said at least one instruct signal is effective at said at least one of said plurality of receiver stations to store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming;

receiving at least one of a code and a datum at said transmitter station, wherein said at least one of a code and a datum designates at least one of said control instruction and said subscriber reaction to said offer;

receiving said at least one control signal at said transmitter station, wherein said at least one control signal operates at said at least one of said plurality of receiver stations to execute said control instruction for processing and use with said at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming;

transferring said at least one of a code and a datum and said at least one control signal to said transmitter at said transmitter station at a specific time; and

transmitting said at least one instruct signal, said at least one of a code and a datum, and said at least one control signal from said transmitter station.

Claim 261:

receiving programming that contains video information;

receiving an instruction, said instruction designating supplemental programming material and having effect at a receiver station to store a control instruction for subsequent processing and use with said programming;

embedding said instruction, said step of embedding translating said instruction to a control signal, wherein said control signal directs an ancillary processor to perform the coordination of said supplemental programming material indicated by said instruction with said programming; and

storing said control signal from said step of embedding, said control signal stored in conjunction with said programming, wherein said supplemental programming material and said ancillary processor are operative to store said control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming, audio programming, data programming, multimedia programming, and computer programming, wherein said method generates and embeds said signals.

Claim 262:

receiving, at one of a broadcast transmitter station and a cablecast transmitter station, said at least one instruct signal which is effective at said at least one of said plurality of receiver stations to store a control instruction for subsequent processing and use with at least one of television programming, radio programming, video programming,

audio programming, data programming, multimedia programming, and computer programming;

delivering said at least one instruct signal to a transmitter;

receiving, at said one of a broadcast transmitter station and a cablecast transmitter station, at least one control signal which at said at least one of said plurality of receiver stations operates to communicate at least one of said at least one instruct signal and said control instruction to a specific processor; and

transferring said at least one control signal to the transmitter, wherein said transmitter transmits said at least one instruct signal and said at least one control signal.

Claim 263:

storing one of television programming and radio programming at a first storage location in said network, said one of television programming and radio programming including at least audio;

transferring, under computer control, said one of television programming and radio programming from said first storage location to a second storage location at a selected one of said at least one intermediate station;

storing said one of television programming and radio programming at said second storage location to enable said selected one of said at least one intermediate station to communicate said stored one of television programming and radio programming from said second storage location to a subscriber station;

communicating a programming identification signal from said origination station to said selected one of said at least one intermediate station, said programming identification signal identifying said one of television programming and radio programming stored at said second storage location;

detecting, at said selected one of said at least one intermediate station, said programming identification signal communicated from said origination station;

communicating said one of television programming and radio programming identified by said programming identification signal from said second storage location to said subscriber station based on said step of detecting said programming identification signal.

Claim 283:

storing one of television programming and radio programming at a first storage location at a first station of said plurality of stations in said network, said one of television programming and radio programming including at least audio;

transferring, under computer control, said one of television programming and radio programming from said first storage location of the first station to a second storage location of a second one of the plurality of stations of said network;

storing said one of television programming and radio programming at said second storage location to enable selective transmission of said one of television programming and radio programming from said second station to a third station of said plurality of stations.

Claim 289:

an origination station including a transmitter for transmitting one of television programming and radio programming with programming identification signals, said one of television programming and radio programming including at least audio;

a plurality of intermediate stations for receiving, processing and selectively retransmitting said one of television programming and radio programming with said programming identification signals received from said origination station, each of said plurality of intermediate stations including:

(a) a receiver for receiving said one of television programming and radio programming with said programming identification signals from said origination station;

- (b) a signal detector for detecting said programming identification signals;
- (c) a plurality of programming storage devices for storing said one of television programming and radio programming;
- (d) a computer operatively connected to said receiver, said signal detector and said plurality of programming storage devices, said computer programmed to perform the following steps:

- (1) identifying said one of television programming and radio programming received by said receiver based on said programming identification signal detected by said signal detector;

- (2) routing said identified one of television programming and radio programming to a first of said plurality of programming storage devices;

- (3) controlling said first of said plurality of programming storage devices to store said identified one of television programming and radio programming on said first of said plurality of programming storage devices;

- (4) transferring said identified one of television programming and radio programming from said first of said plurality of programming storage devices to a second of said plurality of programming storage devices;

- (5) controlling said second of said plurality of programming storage devices to store said identified one of television programming and radio programming on said second of said plurality of programming storage devices; and

- (6) communicating said identified one of television programming and radio programming from said second of said plurality of programming storage devices to a subscriber station; and

said subscriber station including a receiver for receiving programming and signals.

Claim 290:

an origination station including a transmitter for transmitting one of television programming and radio programming with programming identification signals, said one of television programming and radio programming including at least audio;

a plurality of intermediate stations for receiving, processing and selectively retransmitting said one of television programming and radio programming with the programming identification signals received from said origination station, each of said plurality of intermediate stations including:

(a) a receiver for receiving said one of television programming and radio programming with the programming identification signals from said origination station;

(b) a signal detector for detecting the programming identification signals;

(c) a plurality of programming storage devices for storing said one of television programming and radio programming;

(d) a computer operatively connected to said receiver, said signal detector and said plurality of programming storage devices, said computer programmed to perform the following steps:

(1) selecting said one of television programming and radio programming received by said receiver based on the programming identification signals detected by said signal detector;

(2) routing the selected one of television programming and radio programming to a first of said plurality of programming storage devices;

(3) controlling said first of said plurality of programming storage devices to store the selected one of television programming and radio programming on said first of said plurality of programming storage devices;

(4) transferring the selected one of television programming and radio programming from said first of said plurality of programming storage devices to a second of said plurality of programming storage devices;

(5) controlling said second of said plurality of programming storage devices to store the selected one of television programming and radio programming on said second of said plurality of programming storage devices; and

(6) communicating the selected one of television programming and radio programming from said second of said plurality of programming storage devices to a subscriber station; and

the subscriber station comprising a receiver for receiving programming.

Claim 291:

receiving, at said receiver, identification signals that identify specific signal content for at least one of a plurality of concurrent one of broadcast signal transmissions and cablecast signal transmissions;

providing a comparison signal to said processor;

comparing said comparison signal to said received identification signals and generating a control signal identifying a desired one of said plurality of concurrent one of broadcast signal transmissions and cablecast signal transmissions;

tuning the receiver, based on the generated control signal, to receive said desired one of said plurality of concurrent one of broadcast signal transmissions and cablecast signal transmissions; and

performing one of:

(1) responding to an instruct signal detected in said desired signal transmission which is effective to control communication of the mass medium programming;

(2) selecting and storing at least one datum received in said desired signal transmission, said at least one datum in respect of the mass medium programming; and

(3) controlling one of the receiver and a selective transfer device to communicate to one of an output device and a storage device a portion of the mass

medium programming received in said desired one of said plurality of concurrent one of broadcast signal transmissions and cablecast signal transmissions.

Claim 292:

receiving said mass medium programming to be transmitted by said remote intermediate mass medium programming transmitter station and delivering said mass medium programming to said at least one origination transmitter, said mass medium programming having at least one of a code and a datum which is operative to identify and control communication of said mass medium programming in said network;

receiving said at least one control signal which at said remote intermediate mass medium programming transmitter station operates to control communication of said mass medium programming; and

transmitting said at least one control signal from said at least one origination transmitter before a specific time.

Claim 293:

receiving said programming to be transmitted at a transmitter station and delivering said programming to a transmitter;

receiving and storing said at least one instruct signal at said transmitter station, said at least one instruct signal at the at least one receiver station operating to identify and control communication of said programming;

transferring said at least one instruct signal to said transmitter; and

transmitting from said transmitter station an information transmission including said programming and said at least one instruct signal.

Claim 294:

outputting mass medium programming that promotes a specific fashion of presenting data, said interactive mass medium programming output apparatus having an input device to receive input from a subscriber;

prompting said subscriber during said mass medium programming whether said subscriber wants data presented in said specific fashion promoted in said step of outputting, said interactive mass medium programming output apparatus having an output device for outputting said data presented in said specific fashion;

receiving a reply from said subscriber at said input device in response to said step of prompting said subscriber, said interactive mass medium programming output apparatus having a processor for processing said subscriber reply and controlling delivery of said data in response to instructions;

delivering instructions at said interactive mass medium programming output apparatus in response to said step of receiving the reply, said instructions controlling said interactive mass medium programming output apparatus;

processing said instructions from said step of delivering, said instructions effective to store and subsequently process said data; and

presenting said data on the basis of said instructions.

Claim 302:

detecting one of the presence and the absence of one of a broadcast control signal and a cablecast control signal;

inputting an instruct-to-react signal to a processor based on said step of detecting;

controlling said processor to output specific information in response to said step of inputting; and

processing stored data and generating a first control signal in respect of a mass medium programming presentation on the basis of information received from said processor based on said step of controlling.

Claim 320:

receiving and storing schedule information that identifies a plurality of scheduled units of television programming and designates a communication schedule for each of said plurality of scheduled units of television programming;

receiving a television transmission, said transmission comprising at least a portion of said plurality of units of television programming and identification information identifying each of said received units of television programming;

storing said received units of television programming and said identification information on a first storage device;

detecting said identification information stored at a first storage location on said first storage device;

determining that said detected identification information identifies a scheduled unit of said plurality of scheduled units of television programming; and

communicating said scheduled unit of television programming to a subscriber.

Claim 321:

receiving a unit of programming;

scheduling a time for transmitting the unit of programming and a channel or frequency for transmitting the unit of programming;

encoding an identification signal in the unit of programming;

storing the unit of programming including the encoded identification signal in a first storage location;

transferring the unit of programming including the encoded identification signal to a second storage location;

storing the transferred unit of programming including the encoded identification signal in the second storage location;

transmitting the unit of programming including the encoded identification signal from the second storage location to a subscriber at the scheduled time and on the scheduled channel or frequency according to said step of scheduling; and

verifying when and on which channel or frequency the unit of programming including the encoded identification signal was transmitted based on the encoded identification signal.

Claim 333:

receiving a unit of programming from a remote source;

scheduling a time for transmitting the unit of programming and a channel or frequency for transmitting the unit of program;

encoding an identification signal in the unit of programming;

storing the unit of programming including the identification signal on a first video recorder;

transferring the unit of programming including the identification signal to a second video recorder;

storing the transferred unit of programming including the identification signal in the second video recorder;

outputting the stored unit of programming including the identification signal from the second video recorder at the scheduled time;

connecting an output of the second storage device to a channel modulator corresponding to the scheduled channel or frequency;

modulating the unit of programming;

transmitting the modulated unit of programming to a subscriber over a cable network;

detecting the encoded identification signal in the transmitted unit of programming; and

generating a log identifying at least the unit of programming and when and on which channel or frequency the unit of programming was transmitted.

Claim 335:

a receiver for receiving an information transmission, said transmission comprising a unit of programming;

a first video recorder operationally connected to said receiver for storing the received unit of programming;

a second video recorder operationally connected to said second video recorder;

a switch operationally connected to said second video recorder;

a computer operationally connected to said video recorders and said switch;

a signal encoder operationally connected to said computer for encoding a signal into the unit of programming;

a channel modulator operationally connected to said switch for modulating the unit of programming output by said switch;

a cable network operationally connected to said modulator for transmitting the modulated unit of programming to a subscriber;

a verification circuit operationally connected to at least one of said switch and said modulator for verifying when and on which channel or frequency the modulated unit of programming is transmitted, said verification circuit comprising a signal decoder for decoding encoded signals on the modulated unit of programming;

said computer programmed to perform the following steps of:

(a) receiving and storing a programming schedule identifying when and on which channel or frequency the received modulated unit of programming should be transmitted to a subscriber;

(b) controlling the recorders to output the received modulated unit of programming from the first video recorder to the second video recorder;

- (c) controlling the second video recorder to store the modulated unit of programming outputted from the first video recorder;
- (d) controlling the second video recorder to output the modulated unit of programming at the scheduled time;
- (e) controlling the switch to connect the output of the second video recorder to the channel modulator to modulate the outputted modulated unit of programming onto the scheduled channel or frequency and to transmit the modulated unit of programming to the subscriber over the cable network.

Claim 338:

a receiver for receiving an information transmission, said transmission comprising a unit of programming;

a first video recorder operationally connected to said receiver for storing and outputting the unit of programming;

a second video recorder operationally connected to said first video recorder, said second recorder storing the unit of programming output by said first video recorder;

a switch operationally connected to said second video recorder;

a computer operationally connected to said first video recorder, said second video recorder and said switch for controlling said first video recorder to output the unit of programming to said second video recorder and controlling said second video recorder to output the unit of programming to said switch;

a signal encoder operationally connected to said computer for encoding a signal on the unit of programming;

a channel modulator operationally connected to said switch for modulating the unit of programming including the encoded signal output by said second video recorder through said switch;

a cable network operationally connected to said modulator for transmitting the modulated unit of programming to a subscriber; and

a verification circuit operationally connected to at least one of said switch and said modulator for verifying when and on which channel or frequency the modulated unit of programming is transmitted, said verification circuit comprising a signal decoder for decoding encoded signals on the modulated unit of programming.

Claim 339:

selecting a storage device from one of a plurality of programming storage devices;
storing a unit of programming at a storage location on the selected storage device;
storing information indicating that the unit of programming is stored on the selected storage device and indicating the storage location of the unit of programming on the selected storage device;

receiving a broadcast or cablecast transmission comprising an embedded signal, the embedded signal identifying the unit of programming or designating communication of the embedded signal to a subscriber;

detecting the embedded signal;

determining which of the plurality of programming storage devices is storing the unit of programming and the storage location of the unit of programming in response to the detected embedded signal, said step of determining being performed by a receiver station computer based upon (1) the detected signal and (2) the stored information indicating the storage device and the storage location storing the unit of programming;

outputting, under control of the receiver station computer, the unit of programming from the selected storage device in response to said step of determining;

embedding data identifying said outputted unit of programming in said outputted unit of programming;

communicating information from the receiver station to a subscriber comprising the outputted unit of programming and the embedded data;

detecting the embedded data in the information that is communicated from the receiver station;

generating a record or log indicating that the unit of programming was communicated based on said step of detecting the embedded data.

Claim 340:

storing a unit of television or radio programming at a first storage device;

transferring the unit of programming to a second storage device;

storing the unit of programming on the second storage device;

storing information indicating that the unit of programming has been transferred to the second storage device and that the unit of programming is now stored on the second storage device;

storing information indicating the storage location of the unit of programming on the second storage device;

receiving a broadcast or cablecast transmission comprising an embedded signal, said embedded signal identifying the unit of programming or designating its communication to a subscriber;

detecting the embedded signal;

determining which of the plurality of programming storage devices that is storing the unit and the storage location of the unit of programming in response to detecting the embedded signal, said step of determining being performed by a receiver station computer based upon (1) the detected signal and (2) the stored information indicating the storage device storing the unit of programming and the stored information indicating the storage location of the unit of programming;

outputting, under control of the receiver station computer, the unit of programming from the second storage device in response to said step of determining; embedding data identifying said outputted unit of programming in said outputted unit of programming; communicating information from the receiver station to a subscriber comprising the outputted unit of programming and the embedded data; detecting the embedded data in the information that is communicated from the receiver station; generating a record or log indicating that the unit of programming was communicated based on said step of detecting the embedded data.

Claim 341:

receiving at a subscriber station information that designates an instruction to be processed or an output to be delivered; receiving a user reaction to an output at said subscriber station; processing an instruct signal which is effective to identify and control communication of one of a unit of television programming and an output to supplement a television program at said subscriber station in response to said user reaction at said subscriber station, said processing at said subscriber station directed by instructions from said instruct signal; generating an indicium that said instruct signal was delivered or confirming identification and control of said one of a unit of television programming and an output; transferring said indicium from said subscriber station to one or more remote data collection stations.

Claim 342:

receiving said one or more first units of television programming to be transmitted by said remote intermediate television transmitter station and delivering said one or more first units of television programming to one or more origination transmitters, said one or more first units of television programming having one or more first codes or data to identify and control communication of said one or more first units of television programming;

receiving said one or more control signals which at said remote intermediate television transmitter station operate to control communication of said one or more first units of television programming based on said one or more first codes or data; and

transmitting said one or more control signals from said one or more origination transmitters before a specific time.

Claim 379:

(1) receiving one or more control signals which at said remote intermediate television transmitter station operates to control the communication of said plurality of units of television programming based on said one or more first codes or data; and

(2) transmitting said one or more control signals from said one or more origination transmitters before a specific time.

Claim 380:

receiving a signal at said receiver station receiver section;

processing said signal to extract a message from said plurality of messages based on said step of receiving;

storing said extracted message in a storage device; and

displaying said extracted message on a television display in response to a user input at said user input device.

Claim 382:

receiving a plurality of discrete signals at said subscriber station and inputting at least a portion of said plurality of discrete signals to said receiver station;

processing said plurality of discrete signals to extract at least one message based on the step of receiving;

storing said plurality of discrete signals in a storage device;

assembling said plurality of discrete signals into a signal comprising said at least one message; and

controlling said storage device to one of store said at least one message and communicate said at least one message.

Claim 383:

receiving mass medium programming and an instruct signal which is effective at the receiver station to at least one of extract and assemble said at least one message and delivering said mass medium programming and said instruct signal to a transmitter;

receiving said at least one message and communicating said at least one message to a signal embedder;

controlling said signal embedder to embed said at least one message in an information transmission in a pattern of said plurality of discrete signals, said pattern of said plurality of discrete signals having at least one of varying composition, varying timing, and varying location;

communicating said information transmission to said transmitter; and

transmitting said mass medium programming and said information transmission.

Claim 386:

receiving said at least one identification signal that identifies specific signal content for at least one of a plurality of concurrent transmissions, wherein said plurality

of concurrent transmissions comprises one of (i) a plurality of concurrent broadcast signal transmissions, (ii) a plurality of concurrent cablecast signal transmissions, and (iii) a plurality of concurrent broadcast and cablecast signal transmissions;

providing a comparison signal to said processor;

comparing said comparison signal to said at least one identification signal and generating a control signal identifying a desired signal transmission of said plurality of concurrent transmissions;

tuning the receiver, based on the generated control signal, to receive said desired signal transmission of said plurality of concurrent transmissions; and

performing one of:

responding to said control signal detected in said desired signal transmission, said control signal is operative to identify and communicate an electronic message;

selecting and storing at least one data received in said desired signal transmission, said at least one data comprising at least a portion of an electronic message; and

controlling one of a receiver and a selective transmission device to communicate to one of a output device and a storage device an electronic message received in said desired signal transmission.

Claim 387:

receiving said mass medium programming to be transmitted by the remote intermediate mass medium programming transmitter station and delivering said mass medium programming to a transmitter, said mass medium programming is operative to identify and communicate an electronic message;

receiving said at least one control signal at the remote intermediate mass medium programming transmitter station to control communication of said mass medium programming; and

transmitting said at least one control signal to said transmitter before a specific time.

Claim 389:

storing user data of interest;

receiving said mass medium programming at said receiver station from a mass medium programming source and outputting said mass medium programming to said at least one output device, said at least one output device adapted to output said mass medium programming;

receiving one of a broadcast information transmission and a cablecast information transmission at said receiver station, said one of a broadcast information transmission and a cablecast information transmission including at least one instruct signal to direct said selected output to supplement said mass medium programming;

detecting at least one instruct signal in said one of a broadcast information transmission and a cablecast information transmission and passing said detected at least one instruct signal to a processor; and

controlling said processor based on said detected at least one instruct signal, said step of controlling comprising the steps of:

- (a) identifying and communicating an electronic message to supplement said mass medium programming based on said stored user data of interest;
- (b) directing said electronic message to supplement said mass medium programming to said at least one output device.

Claim 391:

receiving one of a code and a datum at a transmitter station, wherein said one of a code and a datum designates one of (i) one of a product and a service offered in said mass

medium program and (ii) said viewer reaction to said specific offer communicated in said mass medium program;

receiving at least one control signal at said transmitter station, said at least one control signal operate to cause at least one receiver station of said plurality of receiver stations to identify and communicate an electronic message;

transferring said one of a code and a datum and said at least one control signal to a transmitter at said transmitter station at a specific time; and

transmitting said one of a code and a datum and said at least one control signal from said transmitter station.

Claim 392:

receiving a programming signal containing mass medium programming;

communicating said programming signal containing said mass medium programming to a storage device and storing said programming signal containing said mass medium programming in said storage device;

receiving downloadable executable code which is effective at a user station to control one of a processor and computer to identify and communicate an electronic message;

communicating said downloadable executable code to said storage device; and
storing said downloadable executable code in said storage device which stores said programming signal containing said mass medium programming.

Claim 393:

embedding said downloadable executable code in one of a television signal and a radio signal;

embedding a code in a signal including said mass medium programming that enables said one of a processor and computer to one of receive information and output

information to supplement said mass medium programming in accordance with said downloadable executable code;

communicating a program unit identification code to said storage device and storing said program unit identification code in said storage which stores said mass medium programming;

communicating to said storage device and storing in said storage device information to be processed at a user station to evidence one of an availability, use, and usage of one of video, audio, and text associated with said mass medium programming;

storing in said storage device an instruct signal which is effective at said user station to select said mass medium programming.

Claim 396:

receiving a program to be transmitted at a transmitter station and delivering said program to a transmitter;

receiving and storing said at least one instruct signal at said transmitter station, said at least one instruct signal at said receiver station operate to identify and communicate an electronic message;

transferring said at least one instruct signal to a transmitter; and

transmitting from said transmitter station an information transmission comprising said program and said at least one instruct signal.

Claim 398:

receiving a plurality of discrete signals at said subscriber station and inputting at least a portion of said plurality of discrete signals to said receiver section;

processing said plurality of discrete signals to extract at least one message based on the step of receiving;

storing said plurality of discrete signals in a storage device;

assembling said plurality of discrete signals into a signal comprising said at least one message; and

controlling said subscriber station in accordance with said signal of said discrete signals based on the step of assembling.

Claim 399:

receiving mass medium programming and an instruct signal which is effective at the receiver station to at least one of extract and assemble said at least one control signal and delivering said mass medium programming and said instruct signal to a transmitter;

receiving said at least one control signal and communicating said at least one control signal to a signal embedder;

controlling said signal embedder to embed said at least one control signal message in an information transmission in a pattern of said plurality of discrete signals, said pattern of said plurality of discrete signals having at least one of varying composition, varying timing, and varying location;

communicating said information transmission to said transmitter; and

transmitting said mass medium programming and said information transmission.

D. Response to Allegation of Defective Oath/Declaration

The Examiner asserts that the oath or declaration is defective (Office Action at 180-182.) The Examiner asserts that the instant application is a continuation-in-part of Application No. 113,329, filed August 30, 1993. Thus, the Examiner requires a new oath or declaration that acknowledges the duty to disclose to the Office all information known to Applicants to be material to patentability which occurred between the filing date of the prior application and the filing date of the instant application. Applicants note that the disclosure as filed March 2, 1995 is identical to the disclosure of Application No.

113,329. Applicants properly filed the instant application under the provisions of 37 C.F.R. § 1.60 as in effect on March 2, 1995. Rule 60 provided conditions under which an Applicant may omit signing a new oath or declaration in a continuation application. Applicants respectfully submit that they have fully complied with the provisions of Rule 60 as in effect upon filing of the instant application. Accordingly, Applicants request that the requirement for a new oath or declaration be withdrawn. Notwithstanding the above, should the Examiner maintain the requirement to file a new oath or declaration, Applicants respectfully request that the requirement be held in abeyance until allowable subject matter is indicated as provided under 37 C.F.R. § 1.111.

The Examiner addresses the preliminary amendment filed March 2, 1995, which substituted on page 1 a paragraph under 35 U.S.C. § 120 including references to related applications. This amendment included the statement: "This is a continuation of application serial no. 08/113,329, filed August 30, 1993, herein incorporated by reference in its entirety." The Examiner apparently believes this statement introduced new matter into the specification. As the document attempted to be incorporated by reference is an *identical* specification to the specification of the instant application, the Examiner's basis for this position is not entirely clear to Applicants. However to advance the prosecution of this application Applicants request that any alleged new matter be canceled by the phrase "herein incorporated by reference in its entirety" from page 1.

E. Response to Objection to the Specification

The Office Action states, "The instant specification is objected to because applicants are changing, some +18 years after making the '81 disclosure, the original written description." (Office Action at 8 & 180.) Applicants note for the record that the amendment to the specification that the Office Action refers to is non-existent in the instant application. Applicants believe that the Office Action was referring to another one of Applicants' co-pending amendments to the specification. However, the instant

amendment to the specification at page 37 corresponds to the allegations raised by the Office Action and will be addressed below.

The amendment changes page 37, lines 23-25, of the specification to read:

Controller, 39, 44, or 47, is preprogrammed to receive [units] words of signal information, to assemble said [units] words into signal [words] units that subscriber station apparatus can receive and process, and to transfer said [words] units to said apparatus.

(Additions underlined, deletions bracketed.)

Applicants submit that this amendment corrects an inadvertent error made in preparation of the specification as filed. The amendment includes no new matter. Applicants respectfully request that the Examiner withdraw the objection for the following reasons.

The amended language describes that aspect of the invention in which signal words are received and assembled into signal units. The assembly of signal words into signal units is described consistently throughout the specification in the manner effected by the amendment. As the amendment merely clarifies the disclosure, the amendment introduces no new matter.

The specification as filed, on page 14, lines 23-25, describes, “discrete words . . . that receiver apparatus must assemble in order to receive one complete instruction.” A signal unit is defined as “one complete signal instruction.” (Spec. at 14 ll. 26-27.) Thus, words must be assembled to create a signal unit. The specification consistently discloses that signal words are received and assembled into signal units.

Further, the specification consistently refers to signal words as the basic information block from which other information units are formed. The specification at page 65, lines 34-35, states; “Each message is composed in a whole number of signal words.” “Said information consists of a series of discrete signal words.” (Spec. at 70 ll. 28-29.) “[S]aid given signal word is an EOFS WORD and may be part of an end of file signal.” (Spec. at 71 ll. 5-7.) “[T]o detect those particular uninterrupted series of EOFS

WORDS that constitute end of file signals.” (Spec. at 74 ll. 11-12.) “For example, end of file signals could include the signal word preceding said uninterrupted sequence.” (Spec. at 82 ll. 23-25.) Signal words are formed into commands and other signals throughout the specification.

In the recent Office Action, the sentence on page 15, lines 4-6, of the specification is relied upon as evidence that the amendment is new matter. (Office Action at 8 & 180.) The sentence reads, “Signal words may contain parts of signal units, whole signal units, or groups of partial or whole signal units or combinations.” This statement simply describes the circumstance in which a higher level word could contain a lower level unit. Obviously, this statement does not contradict the prior statement that discrete *words must* be assembled to obtain a signal *unit*. As signal words are disclosed as being assembled into signal units, the amendment cannot contain new matter, regardless of the other variations disclosed in the specification. The statement relied upon by the Examiner actually supports the conclusion that the amendment does not introduce new matter.

In *Personalized Media Communications, L.L.C. v. International Trade Commission*, No. 97-1532 (Fed. Cir. Jan. 7, 1999), the U.S. Court of Appeals for the Federal Circuit construed claim 35 in U.S. Patent No. 5,335,277 (the ‘277 patent). The ‘277 patent issued to Applicants on August 2, 1994, from a specification identical to the specification filed in the instant application. In construing the claims of the ‘277 patent, the Court concluded that the prosecution history of the ‘277 patent did not prevent the term “information of a selected television unit” from reading on channel and time information. The Court thus addressed the meaning of the term “selected television program unit.” The Court noted that “a selected program unit” is a particular television program, such as Wall Street Week. The Court did not address the meaning of the terms “signal unit” or “signal word.” No reasoning set forth by the Court conflicts with Applicants’ assertion that the specification discloses that signal units are assembled from signal words.

The amended language describes the assembly of signal words into signal units. The assembly of signal words into signal unit is described at page 14, lines 23-27, of the specification. Therefore, the amendment does not include new matter. Accordingly, Applicants request that the objection to the specification be withdrawn.

F. Response to Rejections under 35 U.S.C. § 112

1. Response to Rejections under §112, first paragraph

a) Response to Written Description Rejections

(1) The Office Action Fails to Establish a Prima Facie Rejection Under the Written Description Requirement of 35 U.S.C. § 112

In the Office Action, the Examiner rejects claims 1-399 under 35 U.S.C. § 112, first paragraph for incorporating subject matter not described in the specification as filed in such a manner as to reasonably convey to one skilled in the relevant art that the inventors, at the time the application was filed, were possessed of the claimed invention. (Office Action at 8.) Applicants firmly believe that the instant specification and respective priority documents, all of which are substantially identical, each describe the subject matter of the pending claims. Thus, in Applicants' view, the pending claims fully comply with the requirements of the first paragraph of 35 U.S.C. § 112. Accordingly, Applicants respectfully request the withdrawal of the rejections of claims 1-399 under 35 U.S.C. § 112, first paragraph.

The Examiner notes that the instant specification does not include the exact words and phrases of the disclosure of Applicants' parent Application No. 317,510 (the '81 disclosure.) (Office Action at 3.) The Examiner argues that since Applicants successfully assert that the '81 disclosure supports the pending claims and the '81 disclosure is not duplicated verbatim in the instant specification then it follows that the instant specification does not support the pending claims. The Examiner assumes that the

subject matter in the '81 disclosure that is not duplicated verbatim within the instant specification is omitted from the instant specification. This assumption is incorrect. Applicants maintain that, although the '81 disclosure is not included in identical words in the instant specification, the subject matter of the '81 disclosure is specifically included in the instant specification.

"The function of the description requirement is to ensure that the inventor had possession, as of the filing date of the application relied on, of the specific subject matter later claimed by him." *In re Wertheim*, 541 F.2d 257, 262, 191 U.S.P.Q. 90, 96 (C.C.P.A. 1976). Applicants rely on the filing date of November 3, 1981. On this date, Applicants filed Application No. 317,510, now issued as U.S. Patent No. 4,694,490 (the '490 patent). The specification of the '490 patent (the '81 disclosure) clearly demonstrates that Applicants had possession of the subject matter presently claimed.

"[T]he PTO has the initial burden of presenting evidence or reasons why persons skilled in the art would not recognize in the disclosure a description of the invention defined by the claims." *Id.* at 263, 191 U.S.P.Q. at 97. The Examiner has failed to meet this burden. The record of the prosecution of the instant application fails to include any reasons why persons skilled in the art would not recognize from the specification that Applicants invented the invention defined by the pending claims. The Examiner merely states, at page 15 of the Office Action, that the "instant '571 disclosure has not been found to describe the alleged '81 support ' . . . in such full, clear, concise, and exact terms . . . ' as is required under the law of 35 U.S.C. 112 1st paragraph." The Examiner also provides a list of claim phrases that are deemed to lack support (Office Action at 8-106). This list includes practically all phrases from nearly all the pending claims and amounts to an unsubstantiated assertion that the pending claims as a whole are unsupported under the written description requirement of 35 U.S.C. § 112, first paragraph. The Examiner has failed to present evidence or reasons why persons skilled in the art would not recognize in the disclosure a description of the invention defined by the claims.

The outstanding rejection under the written description requirement is merely a blanket, unsupported statement that the pending claims fail to meet the requirements of 35 U.S.C. § 112, first paragraph. Because the Examiner includes no reasons for the rejection, the only manner for Applicants to respond is to exhaustively demonstrate where each and every limitation in the pending claims is found in the specification without regard to how clearly the specification may show each limitation to those skilled in the art. However in order to advance the prosecution of the instant application, Applicants submit herewith, Appendix A, reciting specification support for each claim limitation to the instant specification at to the parent 1981 priority application.

(2) Applicants' Summary and Description of Integration of the Instant Specification

Each manifestation of Applicants' claimed invention, regardless of how the manifestation may be described in the specification, is a single embodiment of the invention. Thus, the specific support provided for each claim is by definition from within a single embodiment.

Applicants acknowledge that there are numerous embodiments of the presently claimed invention described in the specification. Applicants' specification is a single cohesive document with each successive section and example extending and developing the preceding disclosure. The various disclosures, examples, and subsystems disclosed within the specification are clearly intended to be integrated into general working systems, methods and apparatus. Applicants' specification is very carefully constructed to provide clear and unequivocal contextual relationship between the various inventive concepts, processes and apparatus that Applicants disclose.

At the outset, Applicants focus on the importance of *integrating* functionalities and state:

It is the object of this invention to unlock this great potential in the fullest measure by means of an *integrated system* of programming communication that joins together all these capacities most efficiently.

(Spec. at 3 ll. 30-33)(emphasis added).

In "Background of the Invention" (Spec. at 1-11), Applicants list a multitude of problems and limitations in the prior art for which this integrated system provides valuable solutions. Applicants *also introduce focal opportunity*:

Today great potential exists for combining the capacity of broadcast communications media to convey ideas with the capacity of computers to process and output user specific information. One such combination would provide a new radio-based or broadcast print medium with the capacity for conveying general information to large audiences--e.g., "Stock prices rose today in heavy trading,"--with information of specific relevance to each particular user in the audience--e.g., "but the value of your stock portfolio went down." (Hereinafter, the new media that result from such combinations are called "combined" media.)

Unlocking this potential is desirable because these new media will add substantial richness and variety to the communication of ideas, information and entertainment. Understanding complex subjects and making informed decisions will become easier.

(Spec. at 2 ll. 8-24.)

Applicants explicitly acknowledge that to succeed in the fullest measure means solving many technical problems as well as providing for a broad spectrum of subscriber information demands and equipment capacities:

To unlock this potential fully requires means and methods for combining and controlling receiver systems that are now separate--television and computers, radio and computers, broadcast print and computers, television and computers and broadcast print, etc.

But it requires much more.

To unlock this potential fully requires *a system with efficient capacity* for satisfying the demands of subscribers who have *little receiver apparatus and simple information demands* as well as subscribers who have *extensive apparatus and complex demands*. It requires capacity for transmitting and organizing vastly more information and programming than any one-channel transmission system can possibly convey at one time. It requires capacity for controlling intermediate transmission stations that receive information and programming from many

sources and for organizing the information and programming and retransmitting the information and programming so as to make the use of the information and programming at ultimate receiver stations as efficient as possible.

(Spec. at 2 l. 25 through p. 3 l. 8)(emphasis added).

To disclose how the integrated system overcomes the identified limitations, solves the problems, and realizes this potential fully, requires *step-by-step teaching* of separate elements – methods as well as apparatus – of Applicants' disclosed system. At each new step, the *contextual relationship* of the new teaching to earlier teachings *is explicitly stated*. Applicants highlight below how this step-by-step teaching carries the relationships of the various separate elements throughout the disclosure.

(a) “One Combined Medium” (pages 19-28)

In a section, (Spec. at 19-28), entitled “One Combined Medium,” (Spec. at i l. 16 and p. 19 l. 5), which focuses on the subscriber station of Fig.1, Applicants begin by teaching “a *video/computer* combined medium,” (Spec. at 19 l. 6)(emphasis added). A local image – Fig. 1A (*See* Spec. at 25 ll. 9-14) – is provided at the subscriber station and combined with a remotely supplied video image – Fig. 1B (*See* Spec. at 25 ll. 30-33) – in order to deliver a combined image of Fig 1C (*See* Spec. at 26 ll. 8-15). (Simultaneously, user specific local images are provided at other subscriber station and combined with the remotely supplied video image – (*see*, specification at page 26 lines 16-19.)

(As an example of Applicants' step-by-step teaching approach, not until a section entitled “Audio Overlays and Other Overlays,” which begins on page 463, are Applicants prepared to focus on Fig. 7D and teach “a radio/computer combined medium,” (Spec. at 464 l. 6), or teach “a broadcast print and computer combined medium,” (Spec. at 466 l. 20), or focus on Fig. 7E and teach “the full combined medium of television and computers,” (Spec. at 468 ll. 10-11).

In the “One Combined Medium” section, Applicants disclose concepts of “a combining operation” and “synchronization”. For example: “subscriber station apparatus

... execute *a combining operation in synchronization....*” (Spec. at 26 ll. 21-22)(emphasis added).

Applicants also teach *order* of operations. For example, one operation. (Spec. at 24 ll. 5-27), may provide the local image—Fig. 1A—at the subscriber station; a different operation, (Spec. at 26 ll. 4-11), may deliver the combined image—Fig. 1C. (“One Combined Medium” also discloses that a third operation, (Spec. at 27 ll. 3-7), may terminate delivery of the combined image.)

More broadly, in “One Combined Medium” Applicants teach *important concepts regarding instructions* and, *most importantly, timing*. For example:

Decoder, 203, is **preprogrammed** to detect digital information Microcomputer, 205, is **preprogrammed** ... to respond ... to *instruction signals* embedded in the ... programming transmission.

(Spec. at 21 ll. 14-24)(emphasis added).

In said series in full--and in any one or more subsequent series of instructions--*particular instructions are separated*, as may be required, *by time periods when no instruction* that controls the microcomputer, 205, of any station *is transmitted* which periods allow sufficient time for the microcomputer, 205, of each and every subscriber station *to complete functions* controlled by previously transmitted instructions and commence waiting for a subsequent instruction, in a waiting fashion well known in the art, before receiving a *subsequent instruction*.

(Spec. at 22 ll. 9-18)(emphasis added).

... *an instruction ... causes* subscriber station apparatus to execute a combining operation in *synchronization*

(Spec. at 26 ll. 21-22)(emphasis added).

In addition, personalized programming is displayed *only when* it is of specific relevance to the conventional television programming of said combined medium. In the example, each subscriber views a graphic presentation of his own portfolio performance information *as soon as* it becomes specifically relevant to graphic information of the performance of the market as a whole. Prior to its time of specific relevance, no personalized information is displayed (despite the fact that said graphic information of the performance of the market as a whole is displayed). And said personalized information is displayed *only for so long as* it remains specifically relevant. *As soon as* its specific relevance terminates, its display terminates.

(Spec. at 27 ll. 21-33)(emphasis added).

In the “One Combined Medium” section, Applicants demarcate a critical type of instruction with a definition.

Hereinafter, an instruction ... that causes subscriber station apparatus to execute a combining operation ... is called a “combining synch command.”

(Spec. at 26 ll. 20-23)(emphasis added).

Furthermore, in “One Combined Medium,” Applicants teach a temporal relationship of combining synch commands that have specific functionalities. A *first combining synch command*, (See Spec. at 24 ll. 5-27 and p. 26 ll. 23-28), causes the local image—Fig. 1A—to be provided at the subscriber station. A *second combining synch command*, (See Spec. at 26 ll. 1-8 and 20-23), causes display of the combined image—Fig 1C. (Furthermore, a *third combining synch command*, (See Spec. at 27 ll. 3-7), terminates display of the combined image.) In their step-by-step teachings, Applicants *provide clear contextual pertinence of subsequent teachings by making explicit reference to* the “One Combined Medium” disclosure, and especially by *establishing the temporal relationships of subsequent teachings to the Fig.1C combining and the functionalities provided by these combining synch commands.*

(b) **“The Signal Processor” through “The Normal Transmission Location” (pages 28-86) and “The Preferred Configuration of Controller, 39, and SPAM-Controller, 205C.” (pages 156-162)**

In the specification at pages 28-86 and pages 156-162, Applicants teach apparatus and signaling techniques that are *used throughout the remainder of Applicants’ disclosure*. Applicants teach Signal Processor, (Spec. at 28-34 and Fig.1); Signal Decoder, (Spec. at 34-38 and Figs.2A-2C); and Signal Processor System, (Fig.2D), apparatus. *Applicants also teach in detail the controller* (Spec. at 156-162 and Fig.3A) *apparatus of Signal Decoders* (e.g., controller, 39, in Fig. 2A). Applicants teach signaling techniques in sections entitled “The Composition of Signal Information ...

Commands, Information Segments, and Padding Bits,” (Spec. at 43-49), The Organization of Message Streams ... Messages, Cadence Information, and End of File Signals,” (Spec. at 59-69), “Detecting End of File Signals,” (Spec. at 69-84), and “The Normal Transmission Location,” (Spec. at 84-86).

**(c) “Operating Signal Processor Systems ... Introduction”
through “Operating Signal Processor Systems ... Signal
Record Transfer” (pages 86-278)**

At specification pages 86-278, Applicants teach methods of operating the signal processing apparatus of pages 28-86 and 156-162 explicitly within the context of the “One Combined Medium” disclosure. For example:

Five examples illustrate methods of operating signal processing system apparatus. Each focuses on subscriber stations where the signal processor system of Fig. 2D and *the combined medium apparatus of Fig. 1* share apparatus and operate in common. Fig. 3 shows one such subscriber station.

(Spec. at 86 l. 32 through p. 87 l. 2)(emphasis added).

All five examples describe signal processing variations that relate to *the Fig. 1C combining of “One Combined Medium.”*

(Spec. 87 ll. 30-32)(emphasis added).

Each example focuses on the processing of the three signal messages of the *Fig. 1C combining*. The information of said messages include three combining synch commands and one program instruction set. The first message is of the information associated with the *first combining synch command*. Said first command has a “01” header, an execution segment, and a meter-monitor segment of six fields. Said command is followed by an information segment that contains said program instruction set, and said information segment is followed by an end of file signal. Said first command addresses URS microcomputers, 205, and causes said computers, 205, to load and run the program instruction set transmitted in the information segment.

(Spec. at 89 ll. 3-16)(emphasis added).

The second message is of the information associated with the *second combining synch command*.

(Spec. at 90 ll. 4-5)(emphasis added).

The third message is of the information associated with the *third combining synch command*.

(Spec. at 90 ll. 28-29)(emphasis added).

Repeatedly throughout each of the five examples, reference is made to pertinent “One Combined Medium” disclosures. For example, in Example #1, (Spec. at 93-143), Applicants state:

OPERATING SIGNAL PROCESSOR SYSTEMS ... EXAMPLE #1.

The first example elaborates on the Fig. 1C combining described above in “One Combined Medium” and focuses on the operation of decoder, 203, SPAM-controller, 205C, and microcomputer, 205, on the execution of controlled functions, and on the the use of cadence information to organize signal processing. The example begins as divider, 4, starts to transfer to decoder, 203, in its outputted composite video transmission, the embedded binary information of the first message.

(Spec. at 93 ll. 20-29.)

As described in “One Combined Medium” above, loading and running said program instruction set causes microcomputer, 205, (and URS microcomputers, 205, at other subscriber stations) to place appropriate Fig. 1A image information at particular video RAM.

(Spec. at 107 ll. 20-24.)

In the foregoing fashion and as described in “One Combined Medium” above, said transferred information of the second combining synch command causes microcomputer, 205, to combine the programming of Fig. 1A and of Fig. 1B and transmit said combined programming to monitor, 202M, where Fig. 1C is displayed.

(Spec. at 125 l. 31 through p. 126 l. 1.)

Fig. 3 (which is the combination of the apparatus of Figs. 1 and 2D (*See Spec. at 86 l. 32 et seq.*)) and Fig. 3A (the controller in the decoders 30 and 203 in Fig. 3, (*See Spec. at 156 l. 18 et seq.*)) depict the receiver station at which all five examples occur. Example #1 discloses in detail transfer of SPAM messages to addressed apparatus at the receiver station as well as the execution of controlled functions in response to the messages. Example #2 discloses selective decryption of content of the SPAM message

stream at decryptor 10 of signal processor 200. Example #3 discloses the creation of signal records at signal processor 200 based on monitoring information contained in the message stream that delivers the Fig. 1C image. Example #4 discloses functioning of the Fig. 3A controller 39 in decoder 203, including selective decryption at decryptor 39K and additional processing of the message stream content to create signal records. Example #5 discloses the functioning of signal processor 200 components (e.g., 6, 1, 2, 3, 30 and 40) to gather data on the availability of programming (see, for example, page 269 line 6).

Pages of the specification 271-278, state: “In examples #3, #4, and #5, the transmission of SPAM signal information causes signal processor, 200, to transfer signal record information by telephone to remote station computers,” (Spec. at 271 l. 33 *et seq.*) and teach this process in detail.

(d) “Regulating the Reception and Use of Programming ... including Example #6” and “... Example #7” (pages 278-312) as well as “... More on Example #7 ... Combining ... Automatically to the Computer System ...” (pages 427-447)

At pages 278-312 of the specification, Applicants teach methods of governing the reception and use of programming and relate to, for example, “digital ... television transmissions,” (See Spec. at 279 l. 14). Example #6 discloses a variant of the type of decryption techniques disclosed in examples #2 and #4 to regulate the use of control signal, in particular. Focusing on the receiver station of Fig. 4, (See Spec. at 286 l. 6 through p. 288 l. 20), example #7 discloses a multistage process of selectively decrypting digital components (video and audio) of a “television signal,” (See Spec. at 288 ll. 32-33). The multistage process includes selective transfer, *e.g.*, by tuning or switching, (Spec. at 295 ll. 6-30). At pages 427-447, additional regulating concepts are taught which are variants to the disclosure of pages 287-312, and which rely on disclosures (e.g., intermediate transmitter station automation, (Spec. at 324-390)) which occur in the specification between pages 312 and 427.

Just like every one of examples #1-#5, examples #6 and #7 (Spec. at 287-312 and 427-447) are disclosed within the context of the “Wall Street Week” program. With respect to example #6, see, for example, page 281 lines 7-9. With respect to example #7, see, for example, page 289 lines 12-27 and page 429 lines 26-33. The examples also disclosed functionally and temporally with respect to earlier disclosures such as in “One Combined Medium” at pages 19-28 (e.g., Spec. at 311 ll. 10-16 and p. 447 ll. 8-14).

(e) “Monitoring Receiver Station Reception and Operation” (pages 312-324)

At pages 312-324 of the specification, Applicants teach methods of monitoring the reception and operation of a receiver station using Fig. 5. Fig. 5 shows an extended system of monitoring decoder, controlled by signal processor 200, each monitoring an associated device and communicating monitor information to signal processor 200. This disclosure is also set within the context of the “Wall Street Week” program (See Spec. at 322 ll. 26-27), references Fig. 1B (Spec. at 322 l. 35), and cites previously defined portions of example #3, which concern monitoring (see Spec. at 322 ll. 30-35, p. 174 ll. 21-23, and p. 190 ll. 14-16).

(f) “Automating Intermediate Transmission Stations” (pages 324-390) including “Example #8” (pages 340-354)

At pages 324-390 of the specification, Applicants teach automation of intermediate stations. The teachings relate to forms of programming that include, but are not limited to, television, radio, and data and that apply to all manner of broadcast and cablecast operations (see Spec. at 324 ll. 11-17, p. 339 l. 9 through p. 340 l. 10, and p. 389 l. 14 through p. 390 l. 11). Figs. 6A-B illustrate Applicants’ teachings in the setting of a cable television system. Generally speaking, apparatus of Figs. 6A-B are described at page 324 line 18 through page 328 line 17 and page 337 lines 1-24, and the basic methods of operation of the station (e.g., operating according to a complete programming

schedule) are disclosed at page 325 line 17 through page 326 line 18 and page 328 line 8 through page 331 line 16. Organizing units of prerecorded programming (e.g., to play according to schedule) is disclosed at page 331 line 17 through page 334 line 6. Playing according to schedule is disclosed at page 334 line 7 through page 336 line 35.

Monitoring station operations is disclosed, *inter alia*, (e.g., to provide auditable proof-of-performance) at page 337 line 25 through page 339 line 8. In their teachings of organizing, playing and monitoring, Applicants introduce exemplary programming, including **program unit Q** which is a specific focus of later disclosures in Applicants' specification. Applicants teach the subject matter of pages 324-390 following pages 86-324 to make clear that the earlier teachings apply at intermediate transmission stations as well as end user stations, (e.g., Spec. at 339 l. 29 through p. 340 l. 10 and p. 389 l. 31 through p. 390 l. 11).

In example #8, Applicants teach a distribution station, such as a satellite uplink, which transmits control signals and units of programming, such as television spot commercials, to a plurality of automated intermediate transmission stations as taught at pages 324-340 (Spec. at 340 l. 13 through p. 345 l. 28). The intermediate transmission stations receive the control signals, (e.g., Spec. at 342 l. 18 through p. 343 l. 17 and p. 344 ll. 28-32), and the programming, and store and retransmit selected exemplary television spot commercials – **most focally program unit Q**, (e.g., Spec. at 343 ll. 5-17, p. 351 l. 27 through p. 352 l. 30, and p. 353 ll. 6-28), with each intermediate station operating independently and retransmitting its selected exemplary commercial(s) at different times and in different channels (Spec. at 343 l. 5 through p. 344 l. 22 and p. 345 l. 29 through p. 354 l. 3). The intermediate stations automatically retain and communicate proof-of-performance records to one or more remote auditing stations, (*see* Spec. at 341 ll. 11-15 and p. 352 l. 18 through p. 354 l. 3).

(g) **Examples #9 and #10 (pages 354-390 & 469-516):
“Automating Intermediate ... Station Combined
Medium Operations” (pages 354-374 of Example #9)
and “Network Control of Intermediate Generating and
Embedding” (pages 374-390 of Example #10)**

In examples #9 and #10, at pages 354-374 of the specification for example #9 and pages 374-390 for example #10, Applicants teach automation of an intermediate station in creation and transmission of combined medium programming (“of the same sort as ‘Wall Street Week’” at page 355 lines 1-2). At pages 469-516, Applicants teach the corresponding operations of a plurality of end user stations to which the intermediate station transmits the programming so created. Both examples focus on **Program unit Q** (see Spec. at 354 l. 35 through p. 355 l. 14, p. 374 l. 29 through p. 375 l. 12, p. 469 ll. 1-2, and p. 478 ll. 23-26). In each example, Applicants teach a sequence of messages and carefully **name each message in the sequence with a name that ties together the transmitter functions of pages 354-390 and the corresponding end user station functions of pages 469-516 unambiguously.** (Appendix D, a Glossary of Defined Terms, is included herewith identifying certain terms and defined by their use in the instant specification.) For example, the “program-instruction-set message (#9)” is defined at page 371 lines 17-19 and transmitted at page 372 lines 4-6; the “program-instruction-set message (#10)” is defined at page 385 lines 14-16 and transmitted at page 386 lines 12-14; the “program-instruction-set message (#10)” is received at the end user station(s) at page 484 lines 5-14; and at page 514 lines 8-13, 17 and 23-24 Applicants teach that the “program-instruction-set message (#9)” “[causes] the same functioning” at the end user station(s) as the “program-instruction-set message (#10)”. Some of the other messages in the sequence are named at page 372 lines 20-35, page 387 lines 19-31, page 490 lines 24-34, page 492 lines 1-11, page 495 lines 1-10, etc., and page 514 lines 8-31.

At pages 354-374 in example #9, Applicants teach local **origination**, (Spec. at 374 l. 6 and p. 368 ll. 3-4), of combined medium programming at an automated transmitter station (which is also an intermediate transmission station). **Program unit Q**,

which is delivered to and handled at the intermediate station according to the teachings of pages 324-354, (Spec. at 355 ll. 15-17), is disclosed as television-based combined medium programming, (Spec. at 354 l. 35 through p. 355 l. 14), that contains embedded signals, (e.g., Spec. at 356 l. 9 through p. 358 l. 21, p. 367 ll. 30-33, p. 369 ll. 4-6, and p. 372 ll. 22-35). As one example of the creation of programming, at pages 359 line 14 through page 365 line 21, Applicants teach automation of the intermediate station to create a set of instructions (called "PROGRAM.EXE" at page 365 line 8 and defined as the "program-instruction-set of Q" at page 365 lines 18-21) and to transmit the instructions, (Spec. at 371 l. 11 through p. 372 l. 6), in a "program-instruction-set message," (Spec. at 371 ll. 17-19 and p. 372 ll. 4-6).

At pages 374-390 in example #10, Applicants teach **network origination** (Spec. at 374 ll. 20-31) of combined medium programming and focus especially on the creation of programming *in the network* at automated intermediate stations as well as at an origination station. **Program unit Q** in example #10 is the same program unit Q as in example #10 (Spec. at 375 ll. 7-8). In example #10 Applicants disclose the same creation of programming as in example #9. For example, page 377 line 4 through page 382 line 14 corresponds to page 358 line 26 through page 366 line 18; "PROGRAM.EXE" appears at page 379 line 24, page 380 line 18, and page 382 line 3; definitions of the "program-instruction-set of Q.1" and "program-instruction-set of Q.2" occur at page 378 lines 23-28 and at page 380 lines 20-24 respectively; and generated instructions are transmitted at page 385 line 9 through page 386 line 14 in a "program-instruction-set message." But in contrast to example #9 which focuses on origination at just one transmitter station, in example #10 Applicants teach a plurality of automated intermediate station operating in parallel under control of a network origination station to generate and transmit control instructions messages (*see* Spec. at 59 ll. 29-33) to different end user stations. Furthermore, Applicants teach that the control instructions differ from each

other (e.g., the PROGRAM.EXE files in the messages (Spec. at 484 ll. 9-10 and 17-18) differ (Spec. at 379 ll. 5-31 and p. 380 ll. 7-20)).

The end user station functionalities of examples #9 and #10 are disclosed at pages 469-516. Applicants teach a series of combined medium outputs (e.g., Spec. at 491 ll. 10-16 and p. 506 ll. 17-21) in response to the transmitted control instructions or “messages” (Spec. at 484 ll. 5-18, p. 485 ll. 14-18, p. 490 l. 24 through p. 491 l. 16, and p. 505 l. 32 through p. 506 l. 21). Furthermore, the information outputted in the combined medium outputs differs from end user station end user station (Spec. at 491 ll. 10-29 and p. 506 ll. 17-31). Applicants also teach in examples #9 and #10 *other functionalities, such a viewer interactivity and interactivity with stations remote from the end user stations*, that are discussed more fully below.

**(h) Automating Ultimate Receiver Stations (pages 390-427)
... Regulating Station Environment (pages 396-406) ...
Coordinating a Stereo Simulcast (pages 406-419) ...
Receiving Selected Programming (419-427)**

Focusing on Fig. 7, Applicants teach, at pages 390-396 of the specification, apparatus and functionalities of an end user station including computing, signal processing (e.g. Figs. 2-2D), switching, decrypting, etc., in addition to receivers, storage devices, and various speaker and display devices. On page 396 is additional disclosure associated with the preferred controller, 39, taught at pages 156-162. At pages 396-406, Applicants disclosure concepts associated with broadcast/cablecast control of end receiver station heating/cooling and mechanical systems as well as interactivity associated with, for example, utilities meter reading. At pages 406-419, Applicants teach coordinating separate systems under broadcast/cablecast control – in this case, controlling devices associated with television and radio to present a stereo simulcast – as well as monitoring the devices in order to provide records of the performance of the stereo simulcast and of other presentations at the end user station to a remote data collection

station. At pages 419-427, Applicants teach storing identifiers (e.g., of the stocks in a stock portfolio) and controlling the receiver station (e.g., tuning cable converter 222 at page 423 lines 11-13) to receive identified news at to process the news (e.g., Spec. at 425 ll. 30-34) according to pre-entered instructions of a user.

(i) **More Disclosure in the Context of “Wall Street Week”
(pages 427-469)**

Having taught basic concepts of apparatus and automation of ultimate receiver stations, Applicants teach more advanced concepts within the context of “Wall Street Week” and its many attendant earlier teachings. Applicants’ objective, in so doing, is to **teach how the various teachings, attendant to “Wall Street Week”, relate to each other.**

(j) **More on Example #7 (pages 427-447)**

At pages 427-447 of the specification, Applicants elaborate on the earlier “Regulating Systems” (Spec. at 288 l. 22) teachings of example #7 (Spec at 288-312), which are summarized in section (d) above. Applicants teach the network described in “One Combined Medium” (Spec. at 20 l. 28 through p. 21 l. 4) as a **self structuring, parallel processing computing system**. This teaching follows Applicants teaching of “Automating Intermediate Transmission Stations” (Spec. at 324 l. 7 and pp. 324-390) in order to **elaborate on intermediate transmission station** (e.g., see references to Fig. 6 at page 429 line 29 and page 325 lines 15-16) **automation** within the context of example #7 (e.g., Spec. at 429 l. 26 through p. 435 l. 15) and the teachings attendant to “Wall Street Week” generally. Applicants teach the selective processing of incoming programming in accordance pre-stored “program-unit-of-interest information” (e.g., Spec. at 428 ll. 21-26) that enables different viewer stations to handle differently (e.g., store/display, automatically authorize purchase of) the “Wall Street Week” programming. Applicants teach storage of programming (Spec. at 445 ll. 27-32) that includes (e.g., Fig. 1C) the

locally provided information (*e.g.*, Fig. 1A) combined with the remotely supplied information (*e.g.*, Fig. 1B).

(k) Controlling Combined Medium Operations (pages 447-457)

At pages 447-457 of the specification, Applicants teach the functioning of “One Combined Medium” (Spec. at 19-28) within the context (*e.g.*, Spec. at 451 ll. 1-3) of functions that (i) precede (Spec. at 447 l. 26 through p. 451 l. 11) the beginning of the “One Combined Medium” programming (*i.e.*, “Wall Street Week”) and (ii) follow (Spec. at 451 l. 4 through p. 457 l. 10) the display of Fig. 1C. Applicants teach **providing and updating viewer data (*e.g.*, stock portfolio data) before the start of, for example, “Wall Street Week” and controlling viewer stations to generate and combine into the “One Combined Medium” programming a series of local images with each image combined within its specific time interval of relevance.** Applicants also teach **error correction techniques for controlling viewer station computers that function incorrectly or inefficiently.**

(l) Transmitting Program Instructions Sets (pages 457-463)

Having taught generation of more than one image, inefficiency, and error correction, Applicants teach methods, at pages 457-463, for timely provision of software for controlling the generating and combining of local images (*e.g.*, Fig. 1A) into the “One Combined Medium” programming. These include varying size of the bandwidth in which the software is located, as well as the location(s) and the timing pattern(s) in which the software is transmitted.

(m) Audio Overlays and Other Overlays (pages 463-468)

Focusing on Fig. 7D, Applicants teach a radio combined medium at pages 464-466 of the specification, including local selection at a radio receiver station of user

specific audio and insertion of the selected audio into radio programming supplied from a remote radio transmitter. Applicants teach a broadcast print combined medium at pages 466-468, including local selection at a broadcast print receiver station of user specific text and insertion of the selected text into broadcast print programming supplied from a remote transmitter. Focusing on Fig. 7E, Applicants teach at page 468 a television combined medium that includes customized audio as well as customized video.

**(n) Examples #9 and #10 Continued – Viewer/Listener
Station Functionalities (pages 469-516)**

To teach the viewer/listener station processing of **program unit Q** in examples #9 and #10 (*see* section (g) above), Applicants focus on the “ultimate receiver station” (defined at page 40 line 35 through page 41 line 1) of Fig. 7 (*e.g.*, Spec. at 390 ll. 30-31 and p. 470 l. 9). Having taught the concepts summarized in section (m) above, Applicants can teach receiver stations interconnecting “apparatus ... in the fashion of Fig. 7E” (Spec. at 480 ll. 16-17). In this environment, Applicants teach local interactions (*e.g.*, by humans at page 471 lines 6-18 and page 508 line 19 through page 509 line, and by equipment at, for example, page 484 lines 7-18 and page 509 line 35 through page 511 line 22) result in interaction between local station and remote station equipment (*see* Spec. at 509 l. 35 through p. 510 l. 4). Drawing on virtually every previous teaching, Applicants disclose at pages 469-516 generation of a series of outputs (*e.g.*, Spec. at 485 ll. 14-18) that include video (*e.g.*, Spec. at 491 ll. 10-29), audio (Spec. at 491 l. 30 through p. 493 l. 22), and print (Spec. at 496 l. 3 through p. 499 l. 3). Applicants also disclose error correction, as summarized in the section above, at page 514 line 32 through page 516 line 13. Furthermore, Applicants disclose at page 514 lines 8-31 that the viewer/listener stations perform substantively identically in examples #9 and #10.

**(o) Preprogramming Receiver Station Operating Systems
(pages 516-532) and The Preferred SPAM Header
(pages 532-533)**

At pages 516-532 of the specification, Applicants teach one master control station (*e.g.*, Spec. at 518 ll. 17-26) transmitting operating system instructions to and programming transmitter and receiver station widely dispersed over a geographic area with the operating systems. Each station to be programmed selects those operating system instructions that apply to its particular type and version of reprogrammable device(s) (*e.g.*, Spec. at 522-524), routes the instructions to memory of the reprogrammable device(s), and commences operating under control of the operating system instructions. At pages 532-533, Applicants further focus on the desirability of flexibility for system expansion and teach that the preferred SPAM header is one byte in length.

(p) The General Case ... Summary Example #11 (pages 533-557)

While Applicants could summarize their disclosure by simply stating that each method and feature of their disclosed “unified system” (Spec. at 533 l. 24) could be combined with every other method and feature (on its face an apparent tautology), they choose, instead, to provide one final example which explicitly relies on the entirety of foregoing disclosure. In example #11, programming is distributed in a time cycling fashion (*e.g.*, Spec. at 536 l. 11 *et seq.* and p. 556 ll. 12-14) from a European master control station via satellite (Spec. at 536 ll. 4-6) to national intermediate transmission stations (Spec. at 534 ll. 26-31) which transmit to local intermediate transmission station (Spec. at 535 ll. 18-22) which, in turn, transmit to ultimate receiver stations (Spec. at 534 ll. 1-4) where programming is displayed (*e.g.*, Spec. at 552 ll. 20-30) and information is communicated responsively (*e.g.*, Spec. at 555 ll. 14-29) back to the European master control station and the national and local intermediate stations (Spec. at 555 l. 26 through p. 556 l. 9).

The European master control station controls the national intermediate stations (e.g., Spec. at 541 l. 29 through p. 542 l. 2 and p. 543 ll. 20-29) to control the local intermediate stations (e.g., Spec. at 544 l. 23 through p. 545 l. 11) to control the ultimate receiver stations (e.g., Spec. at 547 ll. 19-26 and p. 548 ll. 1-6). User specific information is generated at each ultimate receiver station (e.g., Spec. at 548 ll. 18-22 and p. 550 ll. 30-31), stored at each ultimate receiver station (e.g., Spec. at 551 ll. 11-14), explained in combined medium output (Spec. at 552 ll. 17-30), and communicated to the European master control station and the national and local intermediate stations (Spec. at 555 l. 26 through p. 556 l. 9). At points in the disclosed example #11 cycle where functions are described in general, reference is made to earlier sections of the specification that teach the detail of how the function is performed. For example, at page 537 lines 6-17, the European master control station is explicitly disclosed as preprogramming the national and local intermediate stations and the ultimate receiver stations in the fashion summarized in the above section.

(q) Conclusion

As demonstrated above, within the specification, many embodiments of the claimed invention are disclosed. Each manifestation of an apparatus or method that includes the subject matter defined by the instant claims is a *single* embodiment of Applicants' invention. Such a single embodiment of Applicants' invention may have elements or steps that are described in detail in various separate sections of the instant specification. Every embodiment of the instant invention that is described by the specification as a whole is a *single* embodiment of the instant invention that provides support under the written description requirement.

It appears, however, that what the Examiner intends to request is that Applicants provide support for every limitation of an individual claim from within a single one of the detailed enumerated examples listed in the specification. In other words, the Examiner

requests that the support provided for all the limitations of an individual claim be contiguous or proximate within *only a portion* of the specification, rather than the specification as a whole. The written description requirement of 35 U.S.C. § 112 does not mandate such contiguous or proximate descriptions of each element or step of every individual claim.

“To fulfill the written description requirement, a patent specification must describe an invention and do so in sufficient detail that one skilled in the art can clearly conclude that the ‘inventor invented the claimed invention.’” *Regents of University of California v. Eli Lilly and Co.*, 119 F.3d 1559, 43 U.S.P.Q.2d 1398, 1404 (Fed. Cir. 1997)(quoting *Lockwood v. American Airlines*, 107 F.3d 1565, 41 U.S.P.Q.2d 1398, 1405 (Fed. Cir. 1997)). Applicants submit that one of ordinary skill in the art would determine that the inventors possessed the claimed invention by recognizing that the embodiments indicated in Appendix A are described in the specification. Since, for the reasons discussed above, one of ordinary skill in the art would recognize that the specification is a single cohesive document containing many descriptions of methods and apparatus included in general integrated systems, there is no reason that the entire support for each individual claim must come from within a single detailed enumerated example described in the specification. However in order to advance the prosecution of the instant application, Applicants have selected embodiments for inclusion in Appendix A that include elements and steps described primarily in a single enumerated example of the specification.

(r) The Subject Matter in the ‘81 Disclosure is Specifically Included In the Instant Specification

Applicants recognize that they must convey that they were in possession of the invention as of the effective filing date of November 3, 1981. Applicants also recognize that the claim of priority under 35 U.S.C. § 120 requires that the previously filed application disclose the invention in the manner provided by the first paragraph of 35

U.S.C. § 112. Accordingly, throughout the prosecution of the pending claims, Applicants have provided support based on the application filed November 3, 1981. Applicants also submit herewith, in Appendix A, support for each claim limitation from the application filed November 3, 1981. Applicants respectfully submit that the detailed support provided in Appendix A demonstrates full compliance with the written description requirement of 35 U.S.C. § 112, first paragraph, and the related requirement of 35 U.S.C. § 120. Additionally, Applicants submit Appendix C herewith, to provide a correlation between the 1981 priority specification (as referenced the column and line numbers of Applicants' U.S. Pat. No. 4,694,490) and the instant specification, and Appendix D containing a Glossary of Defined Terms with respect to the instant specification.

In the Office Action at page 5, the Examiner seeks an explanation for how the '81 disclosure can be considered the specification support. The subject matter in the '81 disclosure is clearly included in the instant specification as demonstrated by Appendix C. Applicants respectfully assert that one skilled in the art, upon recognizing a description of the invention in the '81 disclosure, would readily recognize a description of the invention in the instant specification. The Examiner merely states at page 3 of the Office Action that the previously provided support does not cite the sentences, paragraphs, or passages of the instant specification. Applicants submit that the support provided in Appendix A demonstrates that the instant specification describes the subject matter that is originally disclosed in the '81 application and is presently claimed.

Applicants clarify that the instant specification does not included a verbatim duplication of the '81 disclosure. However, Applicants maintain that the subject matter in the '81 disclosure is specifically included in the instant specification. Neither 35 U.S.C. § 112 nor 35 U.S.C. § 120 requires that the parent application be incorporated into the pending application either by reference or by verbatim repetition. "In order to determine whether a prior application meets the 'written description' requirement with respect to later-filed claims, the prior application need not describe the claimed subject

matter in exactly the same terms as used in the claims; it must simply indicate to persons skilled in the art that as of the earlier date the applicant had invented the what is now claimed.” *Eiselstein v. Frank*, 52 F.3d 1035, 34 U.S.P.Q.2d 1467, 1470 (Fed. Cir. 1995)(citation omitted)(quoting *Vas-Cath v. Mahurkar*, 935 F.2d 1555, 1561, 19 U.S.P.Q.2d 1111, 1116 (Fed. Cir. 1991)). Applicants respectfully submit that the support cited in Appendix A demonstrates that the ‘81 disclosure indicates to persons skilled in the art that as of November 3, 1981, Applicants had invented what is now claimed.

(3) 35 U.S.C. § 112 Includes No Requirement That Identical Embodiments of the Invention be Described in Both a Parent Application and a Subsequent Application Claiming Priority Therefrom

As discussed above, there are many embodiments of the claimed invention disclosed in the specification in such full, clear, concise, and exact terms that one skilled in the art would clearly conclude that Applicants invented the claimed invention as of the effective filing date of the application. There is no conflict or discrepancy for Applicants to refer to one embodiment at one point during the prosecution of the instant application and to refer to another embodiment at a different point. Applicants may independently rely on various embodiments of the claimed invention to demonstrate support under the written description requirement. Likewise, there is no requirement in either 35 U.S.C. § 112 or 35 U.S.C. § 120 that identical embodiments of the invention be described in both a parent application and subsequent application claiming priority therefrom. As noted above, “the prior application need not describe the claimed subject matter in exactly the same terms as used in the claims; it must simply indicate to persons skilled in the art that as of the earlier date the applicant had invented the what is now claimed.” *Eiselstein v. Frank*, 52 F.3d 1035, 34 U.S.P.Q.2d 1467, 1470 (Fed. Cir. 1995)(citation omitted)(quoting *Vas-Cath v. Mahurkar*, 935 F.2d 1555, 1561, 19 U.S.P.Q.2d 1111, 1116 (Fed. Cir. 1991)). “[I]psis verbis disclosure is not necessary to satisfy the written

description requirement of section 112. Instead, the disclosure need only reasonably convey to persons skilled in the art that the inventor had possession of the subject matter in question.” *Fujikawa v. Wattonasin*, 39 U.S.P.Q.2d 1895, 1904 (Fed. Cir. 1996)(quoting *In re Edwards*, 568 F.2d 1349, 1351-52, 196 U.S.P.Q 465, 467 (C.C.P.A. 1978)). Applicants may rely on different embodiments at different times to show that the disclosure conveys to those skilled in the art that Applicants had possession of the claimed subject matter. Applicants respectfully submit that such use of multiple embodiments is permissible to demonstrate compliance with the written description requirement of 35 U.S.C. § 112. However, where clarity permits, Applicants have selected similar embodiments from both the ‘81 disclosure and the instant specification for inclusion in Appendix A to demonstrate compliance with the written description requirement.

(4) Conclusion

The Examiner has failed to establish a *prima facie* rejection under the written description requirement of 35 U.S.C. § 112, first paragraph, because no reasons are given as to why one skilled in the art would not consider the description sufficient. The Examiner also asserts that there is a lack of continuity between the disclosure in the application filed November 3, 1981 and the instant specification. Applicants maintain that, although the ‘81 disclosure is not included in identical words in the instant specification, the subject matter of the ‘81 disclosure is included in the instant specification. Furthermore to demonstrate support for the instant claims, submitted herewith, in Appendix A, are tables demonstrating support for each claim from both the ‘81 disclosure and the instant specification. In view of the above arguments and Appendices A, C & D, Applicants respectfully request that the rejection under the written description requirement of 35 U.S.C. § 112, first paragraph be withdrawn.

b) The Specification Enables One Skilled in the Art to Make and Use the Invention

The Examiner rejects claims 1-399 under the enablement requirement of 35 U.S.C. § 112, first paragraph. (Office Action at 5.) The Examiner concludes that the handling/transmission of “digital television signals” is not enabled by the specification. (Office Action at 107.) The Examiner also concludes that “data” could not be processed in the same manner as television and radio programming units. (Office Action at 113.) However, these conclusions are not directed specifically to the invention claimed by the presently pending claims.

The test for enablement is whether one reasonably skilled in the art could make or use the invention from the disclosure in the application coupled with information known in the art without undue experimentation. *United States v. Teletronics, Inc.*, 857 F.2d 778, 785, 8 U.S.P.Q.2d 1217, 1223 (Fed. Cir. 1988). The invention is defined by the claims presented in the instant application. The Examiner concludes that the terms “digital” and “data” are not enabled. The Examiner fails to consider how these terms define Applicants’ invention in the instant claims. The Examiner has failed to include any analysis of whether any particular claim is supported by the disclosure. The PTO bears the initial burden of setting forth a reasonable explanation as to why it believes that the scope of protection provided by each claim is not adequately enabled by the description of the invention provided in the specification of the application. *In re Wright*, 999 F.2d 1557, 27 U.S.P.Q.2d 1510, 1513 (Fed. Cir. 1993) The Examiner has failed to consider the scope of protection provided by the claims in his analysis under the enablement requirement. Therefore, the Examiner has failed to establish a *prima facie* rejection under the enablement requirement of 35 U.S.C. § 112, first paragraph.

The Examiner suggests Applicants enumerate which claim trees are directed toward an ‘81 embodiment and which are directed toward an ‘87 embodiment. In Part a)(2)(r) above, Applicants have fully addressed this ground of rejection in the context of

the written description requirement. Applicants maintain that each pending claim defines an invention that has embodiments described in both the application originally filed November 3, 1981, and the instant specification. The Examiner has failed to determine that one reasonably skilled in the art could not make or use the invention by the conclusion that the claims "seem to mix and match '81 and '87 disclosed embodiments." Therefore, the Examiner has failed to establish a proper rejection under the enablement requirement of 35 U.S.C. § 112, first paragraph.

(1) "Digital" is Enabled by the Specification

Claims 1-399 stand rejected under 35 U.S.C. § 112, first paragraph, because the Examiner alleges these claims contain subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. (Office Action at 107.) The Examiner asserts the specification fails to disclose the manner in which digital television signals are formatted and processed. The Examiner acknowledges that the transmission of digital television signals was known in the art. The rejection is based on the assertion that the transmission of digital television signals was not interchangeable with the transmission of analog television signals and the Examiner's conclusion that Applicants' disclosure assumes that they are interchangeable. This reasoning is an insufficient basis for the rejection of claims 1-399 for at least two reasons. First, the Examiner's discussion of the transmission and formatting of digital television signals is not directed to the scope of claims 1-399. Second, the means needed to format and transmit digital television signals in a manner compatible with all the methods and apparatus disclosed in the specification was known by those skilled in the art.

Claims 1-399 are fully enabled by the specification. The following are claims in the instant application that specify "digital", i.e.:

Claim 46, "digital audio,"

Claim 48, "digital video,"

Claim 50, "digital data,"

Claim 172, "digital control signal,"

Claim 176, "digital control signal,"

Claim 179, "digital data,"

Claim 329, "digital identification signal;"

Claim 348, "digital data,"

Claim 349, "digital television signal,"

Claim 352, "digital television signal,"

Claim 383, "digital detector," and

Claim 399, "digital detector."

See Appendix A for specification support for the above claims.

Notwithstanding the above arguments, Applicants recognize that the invention defined by the aforementioned claims are compatible with the use of digital television signals. The handling and transmission of digital television signals in a manner compatible with the methods described in the specification were well known to those skilled in the art as of the filing date of the instant application. The Examiner requests Applicants to submit references which show that the means needed to format and transmit "digital television signals" were known to those skilled in the art. Applicants submit that U.S. Patent No. 3,906,480 issued on September 16, 1975 to Schwartz et al. discloses the means needed to format and transmit "digital television signals" in a manner compatible with the methods described in the specification. Schwartz et al. discloses decomposing vectors to be displayed into elemental vector segments that are *encoded* as vector symbols. Schwartz et al. further discloses that the system has the capability of storing each vector in a compacted (i.e. compressed) form while retaining its attributes and identity in storage. Applicants contend that the specification discloses the usage of digital data in a television signal similar to that which is disclosed in Schwartz et al. The

means needed to format and transmit digital television signals in this manner were well known to those skilled in the art as of the filing date of this application.

The Examiner has failed to construe the claims in his analysis under the enablement requirement. The Examiner directs his analysis to the term “digital television signals,” but fails to demonstrate how this analysis applies to Applicants’ claims directed toward “digital” elements. Furthermore, means compatible with Applicants’ disclosure of formatting and transmitting digital television signals were well known in the art, contrary to the Examiner’s assertion. For at least these reasons, Applicants respectfully request the withdrawal of the rejection of the instant claims under the enablement requirement of 35 U.S.C. § 112, first paragraph.

(2) “Data” is Enabled by the Specification

Claims 1-399 and all claims depending therefrom stand rejected under 35 U.S.C. § 112, first paragraph, because the Examiner alleges these claims contain subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. (Office Action at 113.) The Examiner notes that the specification discloses that SPAM messages can be embedded within the “normal locations” of “other media” such as broadcast data or print. The Examiner also notes that the specification discloses that print or data information is transmitted within SPAM messages. Applicants acknowledge the disclosure from line 6 of page 85 through line 11 of page 86 of the instant specification, which describes that SPAM signals may accompany conventional print or data programming. It is unclear to what specific disclosure the Examiner refers by the specific citations recited on pages 115-117, and in the footnote on page 116 of the Office Action. The Examiner asserts that these disclosures are so contradictory that one of ordinary skill in the art would need to resort to undue experimentation to practice the invention. (Office Action at 115.) Applicants firmly assert that a thorough reading of the

specification shows that the disclosure is in no way contradictory with respect to the term "data."

Applicants disclose the use of SPAM signals to control and coordinate a wide variety of subscriber stations. (Spec. at 40.) The information of SPAM signals includes data, computer program instructions, and commands. (Spec. at 41 ll. 20-21.) One typical example of the composition of a SPAM signal is shown in Figure 2E. (Spec. at 44.) The specification clearly discloses that SPAM signals may included information segments. (Spec. at 44 l. 11.) Program instruction sets, intermediate generation sets, other computer information, and data may all be transmitted in information segments. (Spec. at 53 l. 34 through p. 54 l. 2.) Applicants disclose that SPAM signals can be embedded in many different locations in electronic transmissions. (Spec. at 85 ll. 6-7.) In broadcast and data communications transmissions, SPAM signals can accompany conventional print or data programming in the conventional transmission stream. (Spec. at 85 ll. 20-23.) More precisely, the conventional print or data information may be transmitted in an information segment of a SPAM signal. (Spec. at 86 ll. 1-11.) Thus, SPAM signals can be included in broadcast print and data communication transmissions. Also, conventional data information can be transmitted in an information segment of a SPAM signal. There is no conflict in this disclosure. Any person skilled in the art would be enabled to use SPAM signals to control and coordinate a subscriber station through a broadcast data communication transmission by reading the instant specification. After thoroughly reading the specification any person skilled in the art would require no undue experimentation to practice Applicants' claimed invention.

The Examiner asserts that Applicants' disclosure did not describe a system or method which formatted, transmitted, received, processed, or displayed data program units under control of associated SPAM messages because data program units were actually transmitted with the SPAM messages. (Office Action at 116.) The Examiner extends this conclusion to hold that the disclosure fails to set forth the means or steps

needed to make or use systems in which data is manipulated in the same manner as described for television and radio television program units. (Office Action at 117.) The Examiner's conclusion fails to follow from the stated facts. Data program units transmitted with SPAM signals can be manipulated under the control of the associated SPAM signal. The fact that data are disclosed as transmitted in the information segment of SPAM signals in no way conflicts with disclosed control of such transmissions through the use of the SPAM signals.

Furthermore, at most the Examiner's conclusion applies to data communication transmissions that are controlled through the use of SPAM signals accompanying data programming. However, the Examiner makes no attempt to construe the claims to determine how this rejection applies to the scope of each claim. Assuming *arguendo* that the Examiner's reasoning is correct, every use of the term data does not violate the enablement requirement of 35 U.S.C. § 112. Applicants recognize that the pending claims set forth an invention that may be used with broadcast print or data communications transmissions. However, Applicants submit that the instant rejection does not directly apply to the following claim limitations:

Claim 30, "transmitted data units,"

Claim 33, "distributing multimedia data,"

Claim 38, "multimedia data,"

Claim 39, "multimedia data,"

Claim 40, "multimedia data,"

Claim 41, "multimedia data,"

Claim 43, "multimedia data,"

Claim 44, "multimedia data,"

Claim 49, "analog data,"

Claim 63, "identification data,"

Claim 64, "identification data,"

Claim 77, "receiving data from at least one origination transmitter station,"

Claim 79, "communicating data," "processing data," "store data," "receiving data," and "transmitting an information transmission comprising said data,"

Claim 82, "a use of data," and "a source or supplier of data,"

Claim 83, "store or output said data," "decrypting at least a portion of said data," and "communicate said data,"

Claim 84, "selecting data,"

Claim 100, "inputted data," and "generating said subscriber station specific data,"

Claim 133, "subscriber data,"

Claim 140, "data is one of assembled and communicated in said network,"

Claim 152, "transmitting data," "communicating said data," and "receiving said data,"

Claim 153, "processing data," "storing data," "detecting embedded data," and "communicating or outputting data to said television monitor,"

Claim 161, "outputting data to said television monitor,"

Claim 163, "detected data," and "electronic or computer data,"

Claim 175, "embedded data comprises prices for each of a plurality of stock or financial shares,"

Claim 177, "storing said data,"

Claim 178, "processing data," and "embedded data,"

Claim 179, "digital data,"

Claim 180, "embedded data," and "detected data,"

Claim 181, "detected data,"

Claim 188, "embedded data,"

Claim 189, "embedded data,"

Claim 190, "embedded data,"

Claim 192, "embedded data,"

Claim 193, "embedded data,"

Claim 200, "embedded data,"

Claim 201 "embedded data,"

Claim 205, "embedded data," and "detected data,"

Claim 206, "providing data of interest to a receiver station from a remote data source," and "transmitting said data," and

Claim 207, "storing user data."

For at least the above reasons, Applicants submit that the subject matter defined by the above claims are described in the specification in such a way to enable any person skilled the art to make or use Applicants' invention. Accordingly, Applicants respectfully request that the rejection of these claims be withdrawn.

**c) The Best Mode of Practicing the Claimed Invention
Contemplated by Applicants is Disclosed in the Specification**

Claims 1-399 stand rejected under 35 U.S.C. § 112, first paragraph, because it is asserted that the best mode contemplated by the inventor has not been disclosed. (Office Action at 117.) The first paragraph of 35 U.S.C. § 112 provides that the specification "shall set forth the best mode contemplated by the inventor of carrying out his invention." A two step inquiry is used to determine if the best mode requirement is met. *Chemcast Corp. v. Arco Industries Corp.*, 913 F.2d 923, 16 U.S.P.Q.2d 1033,1036 (Fed. Cir. 1990) First, the Examiner must determine whether, at the time Applicants filed their patent application, they knew of a mode of practicing the claimed invention that they considered to be better than any other. *Id.* Second, the Examiner must determine whether the disclosure is adequate to enable one skilled in the art to practice the best mode, if one was known to Applicants. *Id.* This inquiry is designed to preclude applicants from concealing preferred embodiments of their inventions which they have conceived. *Id.* The Examiner has failed to apply this test in rejecting the pending claims under the best mode requirement. The Examiner has failed to present evidence that Applicants concealed any

embodiment of their invention which they considered to be better than the embodiments disclosed in the instant specification. Therefore, Applicants respectfully request the withdrawal of the rejection of claims 1-399 under the best mode requirement of 35 U.S.C. § 112, first paragraph.

The Examiner compares the present case to *In re Ruschig*, 379 F.2d 990, 154 U.S.P.Q. 118 (C.C.P.A. 1967). The misapplication of *Ruschig* by the Examiner cannot substitute for the two step inquiry to be applied under a proper best mode analysis. The reasoning applied in *Ruschig* is inapplicable to the best mode rejection made by the Examiner in the instant case. First, the issue in *Ruschig* was whether a claim was supported by the disclosure of the appellants' application. *Id.* 154 U.S.P.Q. at 119. The analysis in *Ruschig* by the United States Court of Customs and Patent Appeals does not address the best mode requirement. Second, the *Ruschig* analysis is inapplicable to the facts in the instant case. In *Ruschig*, a claimed specific species of a genus of chemical compounds was not named or identified by formula in the specification. *Id.* 154 U.S.P.Q. at 121. The issue was whether the disclosure of the genus along with teachings of a number of other species would lead one skilled in the art to the claimed species. The Court held that the disclosure in *Ruschig* failed to include guides directing the selections required to arrive at the claimed compound rather than any of the many other compounds that could also be made within the genus. *Id.* 154 U.S.P.Q. at 123. The Court employed the analogy of travel through a forest. The Court found that the appellants were pointing to trees, but that there were no blaze marks to single out the trees that led to the unnamed compound. *Id.* 154 U.S.P.Q. at 122. The facts in *Ruschig* are in direct contrast to the present case. In *Ruschig* the claim limitation was *not* named or identified in the specification. In the instant case the Examiner acknowledges that Applicants' disclosure addresses the variety of claim limitations included in the claims. (Office Action at 119.) As the claim limitations are addressed by the instant specification, no blaze marks are required to lead a skilled artisan through a forest of possibilities to find them.

The Examiner asserts that he cannot recognize the pending claimed processes within the "woods." (Office Action at 120.) In response, Applicants have provided detailed support for each claim limitation. Applicants find it disingenuous for the Examiner to now assert that somehow Applicants have erred by describing numerous specific claim limitation details (*i.e.* pointing to the trees that make up the Examiner's woods.)

The Examiner asserts that there is a scattering of teachings across the multiple applications in the chain of continuity of the ancestor applications relied upon by the claim of priority in the instant application. (Office Action at 120.) The Examiner concludes that this scattering constitutes either (1) concealment of the best mode, or (2) a failure to meet the written description requirement. For the reasons set forth above in Part a), Applicants have fully complied with the written description requirement. Also as explained above in Part a), there is no scattering of teachings across applications. The instant application is a proper continuation application of Application No. 096,096, filed September 11, 1987, which in turn is a proper continuation-in-part of Application No. 317,510, filed November 3, 1981. The instant disclosure is substantially identical to the disclosure of Application No. 096,096 (the '87 disclosure.) The instant disclosure includes substantially all the subject matter in the disclosure of Application No. 317,510 (the '81 disclosure) and adds considerable details and improvements to the methods and apparatus disclosed therein. There is no scattering of teachings across these disclosures as asserted by the Examiner.

The Examiner confusingly questions whether Applicants disclosed their best mode in relation to the terms "data," "pending claim processes as a whole," and "digital." In accordance with M.P.E.P. § 2165.03, the Examiner should assume that the best mode is disclosed unless there is evidence to the contrary. The Examiner points to no evidence indicating Applicants contemplated a best mode of carrying out the claimed invention that they have failed to disclose. That the Examiner questions whether the best mode is

disclosed with respect to the “pending claim processes as a whole” is not evidence that Applicants concealed the best mode. With respect to the terms “data” and “digital,” the Examiner has utterly failed to apply the first step of the proper best mode analysis. The Examiner has failed to determine that Applicants knew that one mode was better than another. Therefore, the Examiner has failed to establish a proper best mode rejection. Applicants note that this best mode rejection appears to be a repetition of the enablement rejection, which asserts that no embodiment of Applicants invention claimed using the terms “data” or “digital” is adequately disclosed. The enablement rejection is fully addressed in Part b) above.

The Examiner has failed to apply the proper analysis in rejecting claims 1-399 under the best mode requirement of 35 U.S.C. § 112. The Examiner has failed to determine whether Applicants knew that one mode was better than another at the time the application was filed. Thus, the Examiner cannot determine whether the disclosure is adequate to enable one of ordinary skill in the art to practice the best mode. As the Examiner has failed to establish a proper rejection under the best mode requirement, Applicants respectfully request that these rejections under 35 U.S.C. § 112, first paragraph, be withdrawn.

2. The Claims Comply With 35 U.S.C. § 112, second paragraph

Claims 1-399 stand rejected under 35 U.S.C. § 112, second paragraph. (Office Action at 5 & 121.) The second paragraph of 35 U.S.C. § 112 mandates that the specification conclude with claims that meet two requirements. First, the claims must set forth the subject matter that Applicants regard as their invention. Second, the claims must be definite. The legal standard for definiteness is whether a claim reasonably apprises those of skill in the art of its scope. *In re Warmerdam*, 33 F.3d 1354, 31 U.S.P.Q.2d 1754, 1759 (Fed. Cir. 1994). When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated

when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Applicants submit that the Office Action fails to demonstrate that any claim is directed to subject matter that Applicants do not regard as their invention. The Office Action also fails to demonstrate that any claim fails to reasonably apprise those of skill in the art of its scope. Applicants, therefore, respectfully request the withdrawal of these rejections under 35 U.S.C. § 112, second paragraph.

Claims 1-399 stand rejected under 35 U.S.C. § 112, second paragraph, as being indefinite. This rejection is directed to the terms “programming” and “programming.” No further reasons are given to support this rejection. The Examiner utterly fails to indicate why any claim fails to reasonably apprise those of skill in the art of its scope. This rejection is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection and is therefore invalid under 35 U.S.C. § 132. Accordingly, Applicants respectfully request that this rejection be withdrawn. The claim language “programming” and is address below in Part b).

a) The Claims Define That Which Applicants Regard as Their Invention

Claims 1-399 stand rejected under 35 U.S.C. § 112, second paragraph, because the Examiner asserts that the claims fail to set forth the subject matter which Applicants regard as their invention. (Office Action at 121.) The Examiner requests “to remove all claim terms from pending claims when [their] conceptual meanings are not identical.” This logic is incorrect for the reasons given in Part 1.a)(2)(r) above, in which Applicants maintain that the subject matter in the ‘81 disclosure is specifically included in the instant specification.

Furthermore, the Examiner has merely pointed to evidence that Applicants believe that the claims are supported by the ‘81 disclosure. The conclusion that the claims fail to set forth subject matter which Applicants regard as their invention simply does not follow

from the fact that Applicants believe that the claims are supported by the '81 disclosure. Applicants believe that the claims define an invention that is fully disclosed in both the '81 disclosure and the instant specification. The Examiner has failed to point to any evidence indicating that Applicants regard the invention to be something other than what is defined by the claims. As Applicants have consistently regarded the subject matter defined by the instant claims to be their invention, Applicants respectfully request the withdrawal of this rejection of claims 1-399 under 35 U.S.C. § 112, second paragraph.

**b) There is no discrepancy in the use of the term
"Programming"**

In considering claims, the Examiner suggests that the Applicants' use of the term "programming" in the pending claims is "repugnant to the normal/usual use of said terminology." (Office Action at 96.) The Examiner further suggests that, in the '81 disclosure (in the Parent Application No. 317,510 filed November 3, 1981), the Applicants defined the term "programming" as "everything transmitted over television or radio intended for communication of entertainment or to instruct or inform." The Examiner relies on the definition of programming set forth in the abstract of the disclosure. "The purpose of the Abstract is to enable the Patent and Trademark Office and the public generally to determine quickly from a cursory inspection the nature and gist of the technical disclosure. The abstract shall not be used for interpreting the scope of the claims." 37 C.F.R. § 1.72(b). By properly making reference to the whole specification, the Examiner will get a more complete understanding of Applicants' meaning of the term "programming".

"It is the object of this invention to unlock this potential [for a significant increase in the scope and scale of multi-media and multi-channel presentations] by the development of means and methods which permit progra[m]ming to communicate with equipment that is external to television and radio receivers, particularly computers and computer peripherals such as printers." "It is the further purpose of this invention to

provide means and methods to process and monitor such transmissions and presentations at individual receiver sites and to control, in certain ways, the use of transmitted progra[m]ming and the operation of certain associated equipment. Such receiver sites may be stations or systems that intend to retransmit the progra[m]ming, or they may be end users of the progra[m]ming. The present invention contemplates that certain data may be encrypted and that certain data collected from such processing and monitoring will automatically be transfer[r]ed to a remote geographic location or locations.” U.S. Patent No. 4,694,490, col. 1, ll. 22-24, 36-53.

Applicants contend that the definition of “programming”, to include television and radio entertainment information, computer programming and data to control execution of a processor, in the present application is clearly supported by the definition of the term “programming” in the ‘81 disclosure.

Applicants assert that their use of the term “programming” in the present application is both consistent with normal/usual usage and with the parent application. *Webster’s Seventh New Collegiate Dictionary* (1977) gives separate definitions for the noun and verb forms of “programming”. The noun form of “programming” is defined with a series of gerunds:

“programming or programing ... n : the planning, scheduling, or performing of a program.”

And the noun form of “program”, which includes the word “programming” in its definition, is:

“program or programme ... n ... 1 ... : a public notice 2 a : a brief usu. printed outline of the order to be followed, of the feature or features to be presented, and the persons participating (as in a public exercise, performance, or entertainment) b : the performance of a program; esp : a performance broadcast on radio or television 3 : a plan or system under which action may be taken toward a goal 4 : CURRICULUM 5 : PROSPECTUS, SYLLABUS 6 a : a plan for the programming of a mechanism (as a computer) b : a sequence of coded instructions that can

be inserted into a mechanism (as a computer) or that is part of an organism
7 : matter for programmed instruction”

The verb form of “programming” is defined with the verb form of “program” and
is:

**“program also programme vt -grammed or -gramed; -gramming or -
graming 1 a :** to arrange or furnish a program of or for : BILL **b :** to
enter in a program **2 :** to work out a sequence of operations to be
performed by (a mechanism) : provide with a program **3 :** to insert a
program for (a particular action) into or as if into a mechanism”

Applicants assert that these definitions are entirely consistent with Applicants’
present and parent application. For example, the ‘81 disclosure describes a well known
television program, “Wall Street Week”, at U.S. Patent No. 4,694,490 (hereinafter ‘490)
col. 19 l. 5 through col. 20 l. 7. At ‘490 col. 19 l. 48-53 and col. 19 l. 63 through col. 20
l. 7, Applicants disclose a sequence of operations performed by a mechanism (a
computer) which includes a first output (‘490 col. 19 l. 65 through col. 20 l. 2) and a
second output (‘490 col. 20 l. 6). This sequence of operations is performed in response to
“several instruction signals” (‘490 col. 19 l. 46) followed by “an instruction signal” (‘490
col. 19 l. 60). (That Applicants’ “signals” are coded is disclosed at ‘490 col. 11 lines 12-
14 where a code reader passes the signals to a computer.) Applicants assert that these
disclosed instruction signals (‘490 col. 19 l. 48-53 and 60-67) clearly meet the dictionary
definition of a program--“a sequence of coded instructions that can be inserted into a
mechanism (as a computer)”--and are, in fact, what is now, and was in 1981, widely
known among those of considerably less than ordinary skill in the art as “a computer
program” and as “computer programming”.

Applicants also assert that the first output (‘490 col. 19 l. 65 through col. 20 l. 2)
and a second output (‘490 col. 20 l. 6), *by themselves*, also meet the dictionary definition
of a program--“the performance of a program”. Furthermore, Applicants contend that
they constitute both computer programming *and television programming*. Being
generated and outputted by a computer qualifies them as computer programming. Being

displayed as an integral part of a television program--"Wall Street Week" ('490 col. 19 l. 45, 54-60, and col. 19 l. 67 through col. 20 l. 2)--qualifies them as television programming.

Finally, Applicants assert that this disclosure is in no way inconsistent with the meaning given to "programing" in the Abstract of Applicants' parent disclosure--"everything transmitted over television or radio intended for communication of entertainment or to instruct or inform." Applicants clearly disclose that the signals are "instruction signals embedded in the 'Wall Street Week' programing transmission" ('490 col. 19 l. 43-44) and that "These signals instruct" ('490 col. 19 l. 48) and "This signal instructs" ('490 col. 19 l. 64-65).

For the reasons set forth above, Applicants assert that the term "programming" as used throughout the instant application to include what are commonly known as television, radio and computer programming is clearly and unambiguously supported by the specification as filed and withdrawal of the corresponding rejection is respectfully requested.

G. Response to Rejections under 35 U.S.C. § 102

1. Rejection under 102 (b) over Applicants' U.S. Pat. Nos. '490 & '725

Claims 1-399 stand rejected under 35 U.S.C. § 102(b). The Examiner asserts that claims are clearly anticipated by Applicants' own U.S. Patent Nos. 4,694,490 and 4,704,725. (Office Action at 129.) The instant application claims the benefit under 35 U.S.C. § 120 of the filing date of both the previous applications that matured into the patents relied upon by the Examiner. Accordingly, neither of the patents relied upon by the Examiner is available as a reference under 35 U.S.C. § 102(b). The Examiner asserts that the instant specification fails to adequately support the instant claims. This assertion is incorrect and irrelevant to Applicants' claim of priority under 35 U.S.C. § 120.

Under 35 U.S.C. § 120, an application obtains the benefit of the filing date of a previously filed patent application if (a) the invention is disclosed in the manner provided by the first paragraph of section 112 in the previously filed application, (b) the application is filed by inventors named in the previously filed application, (c) the application is filed before the patenting or abandonment of or termination of proceedings on an application similarly entitled to the benefit of the filing date of the first application, and (d) the application contains a specific reference to the earlier filed application. The instant application meets each of these requirements with respect to Applicants' previous Application No. 317,510 filed November 3, 1981. The Examiner acknowledges that Application No. 317,510, discloses the subject matter of the instant claims. The same inventors as filed the instant application filed application No. 317,510. The instant application was filed before the termination of proceedings of Application No. 113,329, filed August 30, 1993, (currently pending) which is similarly entitled to the benefit of the filing date of Application No. 317,510. The instant application contains a specific reference to the entire chain of Applicants' applications extending back to Application No. 317,510. As the instant application meets all the requirements of 35 U.S.C. § 120, the instant application is entitled the benefit of the effective filing date of November 3, 1981. Accordingly, neither U.S. Patent No. 4,694,490 nor No. 4,704,725 are available as prior art under 35 U.S.C. § 102(b) as neither was patented or published more than one year prior to November 3, 1981.

Furthermore, the Examiner asserts, "this rejection, under 35 U.S.C. § 102(b), is caused by Applicants choice to cite passages that did not exist in the original '87 C.I.P. disclosure." Applicants respectfully assert that the showing that the instant claims are supported by the '81 disclosure cannot form the basis for this rejection under 35 U.S.C. § 102(b). To the contrary, the showing establishes that the instant claims are entitled to an effective filing date of November 3, 1981. Additionally, Applicants assert that the

instant claims are fully supported by the instant specification as discussed above in Part F.1.a) above.

For at least the above reasons, Applicants respectfully submit that U.S. Patents Nos. 4,694,490 and 4,704,725 are not available as prior art with respect to the presently pending claims. Applicants, therefore, request the withdrawal of the rejection of claims 1-399 under 35 U.S.C. § 102(b) as being anticipated by U.S. Patents 4,694,490 and 4,704,725.

H. Response to Rejections under 35 U.S.C. § 103

1. *Prima Facie* Case of Obviousness

To establish a *prima facie* case of obviousness, three basic criteria must be met. First, there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art to modify the reference to combine the teachings. Second, there must be a reasonable expectation of success. Finally, the prior art reference (or references combined) must teach or suggest all the claim recitations. The teaching or suggestion to make the claimed combination and the reasonable expectation of success must both be found in the prior art, not based on Applicants' disclosure. *In re Vaeck*, 947 F.2d 488, 20 U.S.P.Q.2d 1438 (Fed. Cir. 1991). M.P.E.P. 706.02(j).

2. Rejection under 103 (a, b & e) over Applicants WO 89/02682.

Claims 1-399 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Applicants' WO 89/02682.

The Examiner asserts that all the instant claims are unpatentable over WO 89/02682 to the extent that applicants can satisfy the support enablement requirement of Section 112, first paragraph, but not the support requirement. WO 89/02682 is the international publication number of the Applicants' own international application

published March 23, 1989. The specification of this international application substantially corresponds to the specification of the instant application and the specification of the parent application filed September 11, 1987. Claims 2 to 303 are entitled to the effective filing date of November 3, 1981. However, assuming *arguendo* that the claim of priority to the 1981 application is flawed, then the claims are entitled to an effective filing date of September 11, 1987. In either case, this international application published March 23, 1989, is unavailable as prior art. Accordingly, Applicants request the withdrawal of this rejection of claims 1-399 under 35 U.S.C. § 103(a).

3. Rejection over Greenberg, U.S. Pat. No. 4,547,804 in view of Galumbeck et al., U.S. Pat. No. 4,725,886.

Claims 1-399, that are directed to processes of controlling cable head end processes and monitoring of those processes and combined medium presentation, are rejected under 35 U.S.C. § 103(a) as being unpatentable over Greenberg, U.S. Pat. No. 4,547,804 in view of Galumbeck et al., U.S. Pat. No. 4,725,886.

The Office Action states that “considering pending claims of the group 1-399, that cover, *inter alia*, processes of controlling cable head end processes and monitoring of those processes and combined medium presentation are suggested by [Greenberg].”

First, Applicants traverse this rejection on the grounds that Greenberg is an unavailable reference in that it was filed on March 21, 1983, subsequent to Applicants’ priority date of November 3, 1981. Additionally, Galumbeck et al. is an unavailable reference in that it was filed on April 21, 1983, again subsequent to Applicants’ priority date of November 3, 1981.

Secondly, the Office Action fails to analyze any of Applicants’ claim language in the rejection but rather chooses to summarize the specific contents of the instant 399 claims (numbers 1-399) with the statement, “processes of controlling cable head end processes and monitoring of those processes and combined medium presentation.” The

Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected." This rule requires that the Examiner at a minimum identify the claims subject to each ground of rejection.

The Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected. . . . The pertinence of each reference, if not apparent, must be clearly explained and *each rejected claim specified*." (emphasis added) Section 707.07(i) of the M.P.E.P. sets forth, "In every letter, each pending claim should be mentioned by number, and its treatment or status given." Accordingly, to state a valid rejection the Examiner must, at a minimum, specify by number the claims subject to each ground of rejection. The failure of the Examiner to identify by number the claims that may stand rejected results in a statement that is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection. As the purported rejection fails to identify the claims rejected by number, the purported rejection fails to comply with the requirements of 35 U.S.C. § 132, 37 C.F.R. § 1.104(c) and M.P.E.P § 707.07(i).

The Examiner has failed to provide information on which a *prima facie* case of obviousness could be based under 35 U.S.C. § 103(a).

Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be

ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined.

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459, 467 (1966).

The Examiner has utterly failed to conduct the second inquiry set forth in *Graham v. Deere*. The Office Action includes no inquiry into the differences between the prior art and the claims at issue. "Ascertaining the differences between the prior art and the claims at issue requires interpreting the claim language." M.P.E.P. § 2141.02. The Examiner makes no attempt to interpret the claim language. The Examiner makes no attempt to determine whether *the pending claims* are obvious in view of the cited prior art. Rather, the Examiner merely asserts what he feels the applied references teach. The Office Action includes no showing that applied references teach all of the limitations of any of the pending claims. Thus, the Office Action provides insufficient information on which to base a *prima facie* case of obviousness.

Applicants respectfully submit that, notwithstanding the accuracy of the Examiner's characterization of the applied references or applicability of any of these references against the pending claims, for the above reasons the Office Action fails to state a *prima facie* case of obviousness. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

4. Rejection over over Jeffers et al., U.S. Pat. No. 4,739,510.

Claims 1-399, that are directed to, *inter alia*, processes of controlling broadcast subscriber stations, including decrypting, processing, storing, generation and monitoring to those processes and combined medium presentation, are rejected under 35 U.S.C. § 103(a) as being unpatentable over Jeffers et al., U.S. Pat. No. 4,739,510.

The Office Action states that "considering pending claims of the group 1-399, that cover, *inter alia*, processes of controlling broadcast subscriber stations, including decrypting, processing, storing, generation and monitoring to those processes and

combined medium presentation they cover what [Jeffers et al.] suggests...broadcast programming including, *inter alia*, audio and control signals that are digitized and inserted into the horizontal blanking interval of distributed television programming.”

First, Applicants traverse this rejection on the grounds that Jeffers et al. is an unavailable reference in that it was filed on April 2, 1987, subsequent to Applicants’ priority date of November 3, 1981. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

Secondly, the Office Action fails to analyze any of Applicants’ claim language in the rejection but rather chooses to summarize the specific contents of the instant 399 claims (numbers 1-399) with the statement, “processes of controlling broadcast subscriber stations, including decrypting, processing, storing, generation and monitoring to those processes and combined medium presentation ...broadcast programming including, *inter alia*, audio and control signals that are digitized and inserted into the horizontal blanking interval of distributed television programming.” The Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. Under 37 C.F.R. § 1.104(c), “If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected.” This rule requires that the Examiner at a minimum identify the claims subject to each ground of rejection.

The Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Under 37 C.F.R. § 1.104(c), “If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected. . . . The pertinence of each reference, if not apparent, must

be clearly explained and *each rejected claim specified.*" (emphasis added) Section 707.07(i) of the M.P.E.P. sets forth, "In every letter, each pending claim should be mentioned by number, and its treatment or status given." Accordingly, to state a valid rejection the Examiner must, at a minimum, specify by number the claims subject to each ground of rejection. The failure of the Examiner to identify by number the claims that may stand rejected results in a statement that is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection. As the purported rejection fails to identify the claims rejected by number, the purported rejection fails to comply with the requirements of 35 U.S.C. § 132, 37 C.F.R. § 1.104(c) and M.P.E.P § 707.07(i).

The Examiner has failed to provide information on which a *prima facie* case of obviousness could be based under 35 U.S.C. § 103(a).

Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined.

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459, 467 (1966).

The Examiner has utterly failed to conduct the second inquiry set forth in *Graham v. Deere*. The Office Action includes no inquiry into the differences between the prior art and the claims at issue. "Ascertaining the differences between the prior art and the claims at issue requires interpreting the claim language." M.P.E.P. § 2141.02. The Examiner makes no attempt to interpret the claim language. The Examiner makes no attempt to determine whether *the pending claims* are obvious in view of the cited prior art. Rather, the Examiner merely asserts what he feels the applied references teach. The Office Action includes no showing that applied references teach all of the limitations of any of the pending claims. Thus, the Office Action provides insufficient information on which to base a *prima facie* case of obviousness.

Applicants respectfully submit that, notwithstanding the accuracy of the Examiner's characterization of the applied references or applicability of any of these references against the pending claims, for the above reasons the Office Action fails to state a *prima facie* case of obviousness. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

5. Rejection over Hazelwood et al., U.S. Pat. No. 4,025,851 in view of the publication "System and Apparatus for Automatic Monitoring Control of Broadcast Circuits" by Yaname et al. and Hetrich, Australian Patent No. 74,619.

Claims 1-399, that are directed to, *inter alia*, processes of controlling cable head end processes and monitoring of those processes and combined medium presentation are rejected under 35 U.S.C. § 103(a) as being unpatentable over Hazelwood et al., U.S. Pat. No. 4,025,851 in view of the publication "System and Apparatus for Automatic Monitoring Control of Broadcast Circuits" by Yaname et al. and Hetrich, Australian Patent No. 74,619.

a) Characterization of References

(1) Hazelwood et al.

Hazelwood et al. states,

In accordance with a preferred embodiment of the invention, each network originated program is coded with a data signal from which each program may be identified. This coded data signal may take the form of a code identifying the program itself, or the code may identify the source of the program and the time that the program originated to permit the program to be identified from the station logs. The encoding is done by placing binary data on line 20 or any other unused line in the vertical interval. The coded signal is applied to the network where it is received by the network affiliated stations for immediate or delayed broadcast.

A plurality of monitoring sites are disposed about the network coverage area to monitor the programs broadcast by the network affiliates. The monitoring may be done remotely by means of a monitor receiver that receives the programs broadcast by the network affiliates and recovers the data encoded on line 20. Alternatively, the monitoring unit may be installed on the premises of the network affiliate to monitor the program material applied to the transmitter. In the latter

case, there is no need to transmit the data encoded on line 20, and the data may be stripped off by the monitoring unit before the signal is applied to the transmitter.

In either case, the data recovered from line 20 is stored at the remote location in a change format, that is, a format wherein the data is stored once, and new data is stored only when there is a change in the data. In addition, data indicative of the time interval between changes in data is stored. The time information permits delayed broadcasts to be identified since the real-time data will not correspond to the network time data in a delayed broadcast.

Each remote unit is periodically interrogated (usually once per day) via telephone line by a centrally located computer that controls a mini-computer located in each of the remotely located monitor units. Upon interrogation, the mini-computer causes the stored data to be transmitted in blocks to the central computer together with error checking data to permit the central computer to request the remotely located mini-computer to retransmit the data in the event that an error is found. In addition, each remotely located mini-computer may be reprogrammed by the central computer in the event that a modification of the data handling is desired. This is accomplished by providing each remotely located mini-computer with a hard-wired read-only memory (ROM) that initiates the data processing and transmission and a random-access memory (RAM) which may be reprogrammed by the central computer upon completion of the read-only memory routine. (Column 2, lines 8-59.)

In response to the Office Action's characterization of Hazelwood et al., on page 134, the Office Action states that "the embedded codes ... identify the programming being broadcast by *title*,..." (emphasis added). Hazelwood et al. fails to teach identification by "title," but rather, "identified by the source identification code ... and the time of origin ... serving to identify the program. Alternatively, a unique program identifying code can be generated for identifying each program, and used instead of or in addition to the time and source identification code;..." (column 5 lines 61-66).

The Office Action on page 134 characterizes Hazelwood et al. as teaching "the embedded monitoring *instruction* codes..." and, "means for performing communication *programming* to a storage device," (emphasis added). Hazelwood et al. fails to teach "instruction codes," and "performing communication *programming* to a storage device," but rather "a data signal from which each program may be identified," (column 2 line 11), is "transmitted in blocks to a central computer..." (column 2 lines 46-47).

Additionally, the Office Action on page 135 states, "At the encoder 12 of Fig. 1, has to have (sic) been controlled so as to communicate the monitoring codes to the summing circuit 14 at "selected" times in view that the monitoring codes were carried through the line at the selected time in which they were provided to summing circuit 14."

Applicants' best understanding of the Office Action's characterization may apply to:

Claim 9, 16, 21, 28, 29, 35 & 44, "a re-transmission time,"

Claim 6, 10, 13, 18, 22, 25, 36 & 4, "a predetermined time,"

Claim 12 & 328, "a transmission time,"

Claim 33, "asynchronous time,"

Claim 39 & 40, "a synchronizing time,"

Claim 52 & 221, "a specific time,"

Claim 82, 212, 223 & 295, "time of transmission,"

Claim 93, "time for communicating,"

Claim 123 & 145, "a scheduled time,"

Claim 153, "a selected time,"

Claim 211, "a time at which to communicate,"

Claim 214 & 217 "a first time interval of specific relevance,"

Claim 321 & 333, "a time for transmitting,"

Claim 117, 139 & 345 "different times," and

Claim 395, "an output time."

However, Hazelwood et al. mere teaches that "the video information from the camera 10 is combined with the coding information from the encoder 12 at a mixing point 14 before the signal applied to a network feed line 16 which feeds all of the local network affiliates such as the network outlet 18 shown in Fig. 1," (column 3 lines 23-28). There is no teaching in Hazelwood et al. of "selected times" of embedding identification codes other than when programming is being feed from camera 10 to mixing point 14.

(2) Yaname et al.

Yaname et al. teaches at page 15 “transmitting by multiplexing a control signal together with the identification signal on the program signal,” wherein the control signal is characterized by a “ Q_E signal transmitted from Station Line ...[when Q_E is] received by Station M, Station M switches its circuit toward Station Line, and each lower station thereafter switches its circuit toward the next transmitting station in turn.” This switching function as initiated by the control signal (Q_E) at the transmitter stations initiates communication to confirm “that the trouble did not occur between itself and the next higher station, troubleshooting can effect rational recovery action without damaging stations unnecessarily.”

(3) Hetrich

Hetrich teaches control signals “are preferably sent over the network lines during non-programming periods such as the normal one minute station breaks between programs,” (page 11). “These control signals may be used to start and stop audio recorders to record special programs for later broadcast, to accomplish the switching of local and network programs, to interrupt programming for emergency announcements, etc.,” (page 10).

In response to the Office Action’s characterization of Hetrich, the Office Action on page 136 states that, “Hetrich discloses ... embedding control signals used for *identifying* the portions of the network programming which are to be recorded by the storage device of the affiliate stations for delayed re-broadcast,” (emphasis added). However, Hetrich fails to teach or suggest the control signals “identifying the portions of the network programming.” All Hetrich teaches the control signals are operative to do is to “start and stop audio recorders to record special programs for later broadcast, to accomplish the switching of local and network programs, to interrupt programming for emergency announcements,” (at page 10).

Additionally, the Office Action's characterization of Hetrich on page 137 states that, "the control codes are effective to instruct the affiliate station to delay the network programming for some selected period of time." Applicants traverse this interpretation of Hetrich's disclosure since all that the control signals are disclosed to accomplish is to "start and stop audio recorders to record special programs for later broadcast, to accomplish the switching of local and network programs, to interrupt programming for emergency announcements," (at page 10). There is no teaching or suggestion that the control signals "instruct" the network station to delay the network programming, but merely to start and stop a recording device at the network station. The disclosure anticipates the subsequent broadcasting of the special recorded programs, but fails to indicate that the record start/stop control signal additionally "instructs" the subsequent rebroadcasting.

b) Absence of Comparison of Cited References with Applicants' Claim Language

The Office Action states that "considering pending claims of the group 1-399, that cover, *inter alia*, processes of controlling cable head end processes and monitoring of those processes and combined medium presentation [Hazelwood] suggests the term 'processor' wherein the network station, the affiliate station, and the individual circuits which make up the network and affiliate stations, all function to process signals and hence are considered processors of a kind."

The Office Action fails to analyze any of Applicants' claim language in the rejection but rather chooses to summarize the specific contents of the instant 399 claims (numbers 1-399) with the statement, "processes of controlling cable head end processes and monitoring of those processes and combined medium presentation... wherein the network station, the affiliate station, and the individual circuits which make up the network and affiliate stations, all function to process signals and hence are considered processors of a kind." The Examiner has failed to identify which, if any, claims actually

fall into the group that stands rejected. Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected." This rule requires that the Examiner at a minimum identify the claims subject to each ground of rejection.

When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected. . . . The pertinence of each reference, if not apparent, must be clearly explained and *each rejected claim specified*." (emphasis added) Section 707.07(i) of the M.P.E.P. sets forth, "In every letter, each pending claim should be mentioned by number, and its treatment or status given." Accordingly, to state a valid rejection the Examiner must, at a minimum, specify by number the claims subject to each ground of rejection. The failure of the Examiner to identify by number the claims that may stand rejected results in a statement that is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection. As the purported rejection fails to identify the claims rejected by number, the purported rejection fails to comply with the requirements of 35 U.S.C. § 132, 37 C.F.R. § 1.104(c) and M.P.E.P § 707.07(i).

The Examiner has failed to provide information on which a *prima facie* case of obviousness could be based under 35 U.S.C. § 103(a).

Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined.

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459, 467 (1966).

The Examiner has utterly failed to conduct the second inquiry set forth in *Graham v. Deere*. The Office Action includes no inquiry into the differences between the prior art and the claims at issue. "Ascertaining the differences between the prior art and the claims at issue requires interpreting the claim language." M.P.E.P. § 2141.02. The Examiner makes no attempt to interpret the claim language. The Examiner makes no attempt to determine whether *the pending claims* are obvious in view of the cited prior art. Rather, the Examiner merely asserts what he feels the applied references teach. The Office Action includes no showing that applied references teach all of the limitations of any of the pending claims. Thus, the Office Action provides insufficient information on which to base a *prima facie* case of obviousness.

Applicants respectfully submit that, notwithstanding the accuracy of the Examiner's characterization of the applied references or applicability of any of these references against the pending claims, for the above reasons the Office Action fails to state a *prima facie* case of obviousness. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

c) Office Actions Improper Motivation for Combining References

The Office Action on page 136 states, "pending claims of the 1-399, directed to, *inter alia*, processes of controlling cable head end processes and combined medium presentation, not suggested by [Hazelwood et al.], are further suggested [by] Yaname et al. and [Hetrich]." However, the Examiner never states what elements of Applicants' claims were not suggested by the base reference Hazelwood et al. Applicants traverse this rejection as being improper and request withdrawal of the rejection.

(1) Improper Combination of Hazelwood et al. in view of Yaname et al.

Applicants contend that the Office Action improperly combined the switching control codes of Yaname et al. with Hazelwood et al. The disclosure of Hazelwood et al.

is directed toward the storing of embedded program identifiers at either network affiliate stations or at viewer receiver stations. Hazelwood fails to teach or suggest any anticipation of transmitted control codes that alter transmitter stations' circuits to switch output toward upline transmitter stations as taught by Yaname et al. The only disclosure in Hazelwood et al. regarding altering the functionality of a station is the reprogramming of the data collecting monitoring devices by a central data collection station via telephone lines. The Examiner cannot assume it is obvious to modify Hazelwood et al. in view of the control codes of Yaname et al. simply due to the fact that both disclosures have "identification codes" in common, when the base reference Hazelwood et al. fails to anticipate any need for the alleged modifying multiplexed control signal of Yaname et al. that changes the functionality of switching output at a transmitter station. Applicants traverse the rejection combining Hazelwood et al. and Yaname et al. for failing to provide proper motivation for combining the references since there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art to modify the reference to combine the teachings. *In re Vaeck*, 947 F.2d 488, 20 U.S.P.Q.2d 1438 (Fed. Cir. 1991). M.P.E.P. 706.02(j).

(2) Improper Combination of Hazelwood et al. and Yaname et al., further in view of Hetrich.

Assuming *arguendo*, that it would have been obvious to modify Hazelwood et al. in view of Yaname et al., Applicants traverse the combination of Hetrich with the two mentioned references. Applicants contend that there was no motivation provided and that it would be improper to combine the recording start and stop control signals transmitted at station breaks of Hetrich with the transmitting station circuit switch control signals of Yaname et al. The Examiner cannot assume it would have been obvious to modify Hazelwood et al. and Yaname et al. further in view of Hetrich due to the fact that both disclosures have "control signals" in common. Yaname et al. discloses transmitting control codes for the purpose of switching output circuits at transmitter stations for the

purpose of confirming that the transmission trouble (errors) did not occur between itself and the next higher transmitter station. There is no teaching or suggestion in Yaname et al. that the disclosed Q_E signal could be modified to anticipate and other function including the starting and stopping of recorders during non-program periods as disclosed by Hetrich. Applicants traverse the rejection combining Hetrich with Hazelwood et al. and Yaname et al. for failing to provide proper motivation for combining the references since there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art to modify the reference to combine the teachings. *In re Vaeck*, 947 F.2d 488, 20 U.S.P.Q.2d 1438 (Fed. Cir. 1991). M.P.E.P. 706.02(j).

6. **Rejection over either one of the common subject matter suggested by Campbell et al., (WO 81/02961, abandoned parent application no. 135,987, and U.S. Pat. No. 4,536,791), in view of at least one or more of: Breeze "Television Line 21 Encoded Information and It's Impact on Receiver Station Design"; Schnee, U.S. Pat. No. 4,290,142; and Zaboklicki, DE 2,904,891.**

Claims 1-399, that are directed to, *inter alia*, processes of controlling subscriber station processes and monitoring of those processes and of combined medium presentation and processes, are rejected under 35 U.S.C. § 103(a) as being unpatentable over either one of the common subject matter suggested by Campbell et al., (WO 81/02961, abandoned parent application no. 135,987, and U.S. Pat. No. 4,536,791), in view of at least one or more of: Breeze "Television Line 21 Encoded Information and It's Impact on Receiver Station Design"; Schnee, U.S. Pat. No. 4,290,142; and Zaboklicki, DE 2,904,891.

a) Office Action's Failure to Identify Applicants Claim in the Rejection

The Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. Under 37 C.F.R. § 1.104(c), "If the invention is not

considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected.” This rule requires that the Examiner at a minimum identify the claims subject to each ground of rejection.

Applicants summarize the rejection:

- 1) The Office Action states, “Campbell et al. suggest (sic) the claims that cover an addressable cable television control system controlling television program and data signal transmission from the cable head end to the subscriber stations,” (at page 139).
- 2) The Office Action then characterizes the Campbell et al. reference with no specific mention to any claims at issue in the instant application.
- 3) The Office Action then states, “Claims that cover processes of controlling subscriber station processes and monitoring of those processes and of combined medium presentation and processes that are not suggested by Campbell et al. are suggested by Breeze,” (at page 141).
- 4) The Office Action then characterizes the Breeze reference with no specific mention to any claims at issue in the instant application.
- 5) The Office Action then states, “Claims that cover processes of controlling subscriber station processes and monitoring of those processes and of combined medium presentation and processes that are not suggested by Campbell et al. and are not suggested by Breeze, are suggested by [Schnee],” (at page 142).
- 6) The Office Action then characterizes the Schnee reference with no specific mention to any claims at issue in the instant application.
- 7) The Office Action then states, “Claims that cover processes of controlling subscriber station processes and monitoring of those processes and of combined medium presentation and processes that are not suggested by Campbell et al. and are not suggested by Breeze, are not suggested by [Schnee], are suggested by [Zaboklicki],” (at page 142).

8) The Office Action then characterizes the Zaboklicki reference with no specific mention to any claims at issue in the instant application.

9) The Office Action states that “it would have been obvious ... for providing cable subscribers with enhanced interactive processes including enhanced conventional entertainment, providing useful information, and offering greater control to the cable head end operators.” Applicants note that in the entire rejection, not one word of Applicants’ instant claim language was addressed. It seems that the Examiner uses broad characterizations of general concepts found in the instant application and elsewhere in Applicants’ co-pending applications to make this rejection.

Applicants traverse this grounds of this rejection as being improper for failing to identify Applicants’ specific claim language that allegedly reads on the prior art.

When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Under 37 C.F.R. § 1.104(c), “If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected. . . . The pertinence of each reference, if not apparent, must be clearly explained and *each rejected claim specified*.” (emphasis added) Section 707.07(i) of the M.P.E.P. sets forth, “In every letter, each pending claim should be mentioned by number, and its treatment or status given.” Accordingly, to state a valid rejection the Examiner must, at a minimum, specify by number the claims subject to each ground of rejection. The failure of the Examiner to identify by number the claims that may stand rejected results in a statement that is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection. As the purported rejection fails to identify the claims rejected by number, the purported rejection fails to comply with the requirements of 35 U.S.C. § 132, 37 C.F.R. § 1.104(c) and M.P.E.P § 707.07(i).

The Examiner has failed to provide information on which a *prima facie* case of obviousness could be based under 35 U.S.C. § 103(a).

Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined.

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459, 467 (1966).

The Examiner has utterly failed to conduct the second inquiry set forth in *Graham v. Deere*. The Office Action includes no inquiry into the differences between the prior art and the claims at issue. "Ascertaining the differences between the prior art and the claims at issue requires interpreting the claim language." M.P.E.P. § 2141.02. The Examiner makes no attempt to interpret the claim language. The Examiner makes no attempt to determine whether *the pending claims* are obvious in view of the cited prior art. Rather, the Examiner merely asserts what he feels the applied references teach. The Office Action includes no showing that applied references teach all of the limitations of any of the pending claims. Thus, the Office Action provides insufficient information on which to base a *prima facie* case of obviousness.

Applicants respectfully submit that, notwithstanding the accuracy of the Examiner's characterization of the applied references or applicability of any of these references against the pending claims, for the above reasons the Office Action fails to state a *prima facie* case of obviousness. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

b) Rejection further in view of Zaboklicki.

Zaboklicki discusses in general terms (as best understood by Applicants) an "interactive television system" (i) wherein "a local central unit is provided in the home television receivers on the receiver side; that central unit switches the data selection systems on the basis of the television viewer's answer and on the basis of the centrally

transmitted digital processing program for the television segments (transmission fragments)” (English language translation of DE 29 04 981 A 1 at 10 ll. 13 - 18); (ii) with “individual variants of ... additional information ... passed on in the form of acoustic or sound signals in the television receiver in the infrared band to the individual infrared receivers” (*id.* at 11 ll. 2 - 7); (iii) with “participation of the television viewer in the centrally transmitted telecast in such a way that the output signals of the local central unit in the viewfinder of the television camera turn on the contours of the person is provided for by the director [whereby the shape of the viewer contained in these contours is blended into the main content” (*id.* at page 12, lines 8 - 13); and (iv) wherein, “[i]n the case of telecasts where an answer or the opinion of the television viewers is desired... the viewer’s answer is put out parallel and converted into telephone signals... introduced into the subscriber telephone line... [and] supplied to the monitor in the television studio after statistical processing” (*id.* at 12, l. 13 through p. 13 l. 3).

In fact, Zaboklicki is so vague and indefinite in its description of the technology that virtually any reliance on the publication as prior art in the instant application can only be based on speculation and conjecture about the functionalities alleged to be provided by, or the method of operation of, the Zaboklicki system. Zaboklicki is not an enabling publication.

Applicants note the PTO has supplied and relies on a translation of German Patent publication No. DE 2904981 A 1 in formulating the rejections of the subject claims. Applicants have found that the applied German Patent publication is based on an earlier Polish patent application No. PL 204525 A filed February 9, 1978. In addition to the German publication, the earlier Polish application also forms the basis for French patent publication FR 2417226 A published October 12, 1979 and British patent publication GB 2016874 A published September 26, 1979.

After careful review of the Polish application and British publication, it is self evident that neither the translation provided by the PTO nor the British patent publication

(presumably prepared or approved by Zaboklicki) indicates or suggests any method of operation of, or relationship between, the blocks shown in the various figures. In fact, it is difficult or impossible to determine what functions are being performed by the blocks shown in the various figures because many of the labels are not descriptive, failing to articulate or indicate the intended function. The written description does not cure this defect of the disclosure, failing to describe the functions or the interactions between the blocks. Examples of labels inadequately describing the structure of and function performed by the corresponding blocks are included in the following table.

Ref. No	Label	Description	
		English Language Translation of German Patent Publication	British Patent Publication
4	The circuit for the prescreening of information items for television viewers	preliminary screening of the information items for the television viewer	distributes the information for viewers
5	The control circuit	None	output of control system 5 is additionally fed to the circuits 8 and 10 and is also applied to a circuit 11 for restoring the music signal
6	The central unit (the processor, for example, integrated microprocessor)	the output signals of the central unit 6 control a data selection circuit 8; energizes a sound signal switching unit 20 in at least one additional sound channel	output of circuit 3 is fed to a processor 6 ... [which] is also fed with signals representing the viewer's answer from the circuit 2 [and] transmits a digital programme of manipulation, viewers' answers and the successive identification data of ... individual fragments of the broadcast to a store or memory (RAM) 7; keyboard 12 feed into the processor 6 and the latter output to a transmitter of infra-red signals 13 which produces a remote control signal at 14; Digital data and audio signals with different variants of additional information are applied at 15 to the input of a receiver 16 of infra-red signals having an output in the form of digital data fed over line 17 to processor 6; switching-on of the selected audio channel as determined by the processor 6
10	The circuit for video signal conversion and image illumination	used to convert video signals and for image illumination	for converting video signals and displaying a picture

Ref. No	Label	Description	
		English Language Translation of German Patent Publication	British Patent Publication
11	The circuit for sound signal restitution	circuit for sound signal restitution	for restoring
15	The digital data and the phonics with the different variants of additional information	None	input of receiver 16
19	The command for sound turn-on in the corresponding channel	command for a sound signal of a corresponding channel that is supplied to a circuit 20 for turning on the selected sound channel	commands to switch-on the audio signal from a specific channel are fed over the command line 19 from the processor 6 to the receiver 20
27	The switchover of the television channels for the prescreening of the corresponding fragments of a telecast	line for switching over television channels for preliminary screening of the corresponding fragments of a telecast	television receiver 54 is fed over line 53 with control signals from the remote control signal receiver 52 and over the one 27 from the output system 49 of the processor
28	The short term of call signal transmission during which the answer is delayed	control signal for the delay of the answer, which represent the short span of time during which call signal transmission takes place and during that time span, the answer is delayed.	[Control system 32] is also fed via 28 with a short delay signal for sending the dialing signals when the answer is postponed
29	The prefix generator for transmission announcement of the television viewer's answer	for a transmission announcement of the television viewer's answer with a subscriber generator 30 and with a circuit 31 to generate the television viewer's answer	prefix generator for announcing the transmission of the televiewer's answer
35	The circuit for the introduction of the initial data of the television viewers	serves to put in initial data from the television viewers	circuit for introducing the televiewer's answers
36	The circuit for the prescreening of the digital data from the video signal	causes the preliminary screening of the digital data of the video signal	system for distributing the digital data from the video signals
38	The multiplexer circuit	supplies a signal for the subscriber telephone line 33.	Output from the units 29 and 30, 31 and 32 are applied to a multiplexer 38 whose output 46 is in turn fed to a subscriber telephone line
40	The circuit for the prescreening of the digital handling program (telesoftware) and the identification data of the individual fragments of the telecast	for the prescreening of digital processing programs and the identification data of the individual transmission fragments with the input circuits 39	system for separation of the telesoftware and the identification data of the individual fragments of the broadcast

Ref. No	Label	Description	
		English Language Translation of German Patent Publication	British Patent Publication
41	The data selection circuit of the circuit for the comparison of the addresses of the teletext information items	constitutes a data selection circuit or a circuit for the comparison of the addresses of text information, for example, page numbers. Local central unit 6 switches over the data selection circuits 41 as a result of the answers form a television viewer and the digital processing programs which are supplied to the central unit 39 by the output circuit	information selections system or a system for comparing the address of the teletext information, for example the page number, in conjunction with the local processor 6 for switching over the information selection system depending upon the viewers answer and on the telesoftware
42	generator of the alphanumeric and graphic symbols	generator for alphanumeric and graphic symbols	alphanumeric and graphic character generator
43	circuit for turning on one of the additional sound channels in the television receiver (54)	switch-on or for the operation of additional sound channels of a television receiver 54	audio channel switch for switching on the sound signal in the television receiver
45	multiplexer circuit	multiplexer circuit	multiplexer of the receiver
46	signal output for the subscriber telephone line	None	none
47	circuit for the prescreening of the symbols for the control of the image illumination function	prefiltering or prescreening of the symbols for the control of image illumination	system for distributing characters to the display control
48	output circuit for symbols	output circuit	character output system
51	multiplexer circuit in the viewfinder of the television camera for the application of the graphic symbols on the image	multiplexer circuit 51 in the viewfinder of a television camera is used to project the graphic symbols into the image of receiver 54 of the television camera that furthermore is connected to a receiver 52 for a remote-control signal	multiplexer system
54	television receiver with at least one additional sound channel	Receiver	television receiver including an audio channel switch 43 for switching on the sound signal I the television receive and an output circuit 55 for the video signal

Ref. No	Label	Description	
		English Language Translation of German Patent Publication	British Patent Publication
56	teletext decoder with the additional data output after hamming decoder	a video text decoder 56 with an additional data output (hamming decoder)	teletex decoder having an additional data output behind the Hamming decoder comprising a control system 26, a system 36 for distributing the digital data from the video signals, a system 40 for separation of the telesoftware and the identification data of the individual fragments of the broadcast, an information selection system 41, (or a system for comparing the address of the teletex information, for example the page number, in conjunction with the local processor 6 for switching over the information selection system depending upon the viewers answer and upon the telesoftware), an RAM memory 44, a system 57 for distributing control characters, (for example no display), an alphanumeric and graphic character generator 42, a system 47 for distributing characters to the display control and a character output system 48.
57	circuit for the prescreening of the control symbols, for example, a command: do not illuminate	A circuit 57 in decoder 56 is used for the prefiltering of control signals or control commands (For example, do not illuminate.)	system for distributing control characters, (for example no display)

It is established that prior art must be enabling. *Rockwell Int'l. Corp. v. United States*, 147 F.3d 1358, 1365, 27 U.S.P.Q.2d 1027 (Fed. Cir. 1998). "In order to render a claimed apparatus or method obvious, the prior art must enable one skilled in the art to make and use the apparatus or method." *Beckman Industries, Inc. v. LKB Produkter AB*, 892 F.2d 1547, 1551, 13 U.S.P.Q.2d 1301, 1304 (Fed. Cir. 1989) (citing *In re Payne*, 606 F.2d 303, 314, 203 U.S.P.Q. 245, 255 (CCPA 1979)). Accordingly, in *Beckman*, held as a correct statement of the law were jury instructions that stated, "References relied upon to support a rejection for obviousness must provide an enabling disclosure. That is to say, they must place the claimed invention in the possession of the public." *Id.* at 1550-51, 13 U.S.P.Q.2d at 1303-4. The Federal Circuit has observed that "even if the claimed

invention is disclosed in a printed publication, that disclosure will not suffice as prior art if it was not enabling.” *In re Donohue*, 766 F.2d 531, 533, 226 U.S.P.Q. 619, 621 (Fed. Cir. 1985) (citing *In re Borst*, 345 F.2d 851, 855, 145 U.S.P.Q. 554, 557 (C.C.P.A. 1965), cert. denied, 382 U.S. 973, 148 U.S.P.Q. 771 (1966) (“the disclosure must be such as will give possession of the invention to the person of ordinary skill”)). *See also In re Epstein*, 32 F.3d 1559, 1568, 31 U.S.P.Q.2d 1817, 1823 (Fed. Cir. 1994); *Reading & Bates Construction Co. v. Baker Energy Resources Corp.*, 748 F.2d 645, 651-52, 223 U.S.P.Q. 1168, 1173 (Fed. Cir. 1984); *Preemption Devices, Inc. v. Minnesota Mining & Manufacturing Co.*, 732 F.2d 903, 906, 221 U.S.P.Q. 841, 843 (Fed. Cir. 1984).

If anything is clear, it is that Zaboklicki does not place the technology of Applicants’ invention into the hands of the public. The reference to Zaboklicki at most presents some block diagrams which, as best understood, are directed to the four functions previously outlined. The details of these functionalities or how they are accomplished are not described in sufficient detail or with sufficient clarity to constitute an enabling disclosure.

Therefore, Applicants respectfully request the withdrawal of this rejection of claims 1-399 under 35 U.S.C. § 103(a).

7. **Rejection further in view of one or more of: Hazelwood et al., Yaname et al., Hetrich, Marsden, Young et al., "Journal of SMPTE" Oct. 1971, U.S. Pat. No. 3,761,888 to Flynn, U.S. Pat. No. 3,627,914 to Davis, Tunmann et al., U.K. Pat. No. 959,374 to Germany, Byloff, Chiddix, Skilton, Schiller et al., Zettl, Vikene, U.S. Pat. No. 4,547,804 to Greenberg, Jeffers et al., Diederich, Campbell et al. (WO 81/02961, abandoned U.S. application no. 135,987, and U.S. Pat. No. 4,536,791), Kazama et al., Gosch, Stern, Breeze, Barlow, Millar, U.S. Pat. No. 4,725,886 to Galumbeck et al., "CBS/CCETT North American Broadcast Teletext Specification," Zaboklicki, U.S. Pat. No. 4,064,490 to Nagel, U.S. Pat. No. 4,251,691 to Kakihara, Hedger et al., Anderson, Gunn, Gaucher, U.S. Pat. No. 4,290,142 to Schnee et al.**

Claims 1-399, that are directed to, *inter alia*, either processes of controlling affiliate stations and processes and monitoring of those processes and combined medium presentation or processes of controlling subscriber stations and method and process for monitoring and providing combined medium presentations, that fall out each particular determining group members of the group of claims described in rejection above, the groups are rejected further in view of one or more of: Hazelwood et al., Yaname et al., Hetrich, Marsden, Young et al., "Journal of SMPTE" Oct. 1971, U.S. Pat. No. 3,761,888 to Flynn, U.S. Pat. No. 3,627,914 to Davis, Tunmann et al., U.K. Pat. No. 959,374 to Germany, Byloff, Chiddix, Skilton, Schiller et al., Zettl, Vikene, U.S. Pat. No. 4,547,804 to Greenberg, Jeffers et al., Diederich, Campbell et al. (WO 81/02961, abandoned U.S. application no. 135,987, and U.S. Pat. No. 4,536,791), Kazama et al., Gosch, Stern, Breeze, Barlow, Millar, U.S. Pat. No. 4,725,886 to Galumbeck et al., "CBS/CCETT North American Broadcast Teletext Specification," Zaboklicki, U.S. Pat. No. 4,064,490 to Nagel, U.S. Pat. No. 4,251,691 to Kakihara, Hedger et al., Anderson, Gunn, Gaucher, U.S. Pat. No. 4,290,142 to Schnee et al.

a) The Provisional Rejection over Numerous References is Improper

Paragraph 19 of the Office Action it is stated: "Pending claims of the group 1-399 that are directed to, *inter alia*, either process of controlling affiliate stations and processes and monitoring of those processes and combined medium presentation or processes of controlling subscriber stations and method and process for monitoring and providing combined medium presentations, or both, that fall out each particular determined group members of the group of claims described in rejection above, the groups are provisionally rejected further in view of one or more of [some thirty-six listed references]." This statement clearly fails to state a proper rejection. This statement fails to provide reasons for a rejection and is clearly so uninformative that it prevents the applicant from recognizing and seeking to counter any potential grounds for rejection. Applicants cannot determine to what claims this statement is applicable. The Examiner has failed to cite to the best references and avoid merely cumulative references. The references cited include at least some that cannot be relied upon as prior art against the pending claims. The Examiner has failed to explain the pertinence of each reference and to specify each rejected claim. The Office Action includes an explanation of the Examiner's understanding of the level of skill in the art in terms of some of the cited references. However, this explanation fails to include the elements of a proper rejection under 35 U.S.C. § 103(a). Furthermore, the statement does not purport to be a rejection, but rather states that groups are *provisionally* rejected. Applicants find no rejection in this statement by the Examiner to which a response from Applicants is required.

The Examiner has no authority to "provisionally" reject claims in view of one or more of a large group of generally cumulative references. The Office Action includes no reference to any authority for this "provisional" rejection. The M.P.E.P. provides for a provisional rejection only in the situation where a pending application upon issuance will become valid prior art, against provisionally rejected claims, under 35 U.S.C. § 102(e),

35 U.S.C. § 101 (statutory double patenting), or the judicially created doctrine of obvious type double patenting. The pending application used in the provisional rejection must have a common assignee or common inventor with the application containing the provisionally rejected claims. *See*, M.P.E.P §§ 706.02(f), 706.02(k), and 804. The provisional rejection is permitted to alert applicants that they should expect an actual rejection on the merits if and when the applied pending application issues. There is no authority nor is there any good reason to issue a provisional rejection over references that are issued patents or have been published. The Examiner appears to attempt to alert Applicants to potential rejections that will be made once the Examiner has fully reviewed and analyzed the instant application to determine whether the claims define a useful, novel, non-obvious, and enabled invention that has been clearly described in the specification. However, the Examiner should clearly articulate any rejection early in the prosecution process so Applicants have the opportunity to provide evidence of patentability and otherwise respond completely at the earliest opportunity. M.P.E.P. § 706. The Examiner may not reserve rejections for future actions. “The examiner’s action will be complete as to all matters.” 37 C.F.R. § 1.104(b). “If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable *will* be rejected.” 37 C.F.R. § 1.104(c)(1)(emphasis added). As this purported “provisional” rejection is asserted under no authority and fails to clearly articulate any rejection, Applicants respectfully submit that this “provisional” rejection has no effect on the instant application.

b) Rejection under 35 U.S.C. § 103 is Improper

Additionally, this statement fails to provide reasons for a rejection and is clearly so uninformative that it prevents the applicant from recognizing and seeking to counter any potential grounds for rejection. Applicants cannot determine to what claims this statement is applicable. The Examiner has failed to cite to the best references and avoid

merely cumulative references. The references cited include at least some that cannot be relied upon as prior art against the pending claims. The Examiner has failed to explain the pertinence of each reference and to specify each rejected claim. The Office Action includes an explanation of the Examiner's understanding of the level of skill in the art in terms of some of the cited references. However, this explanation fails to include the elements of a proper rejection under 35 U.S.C. § 103(a).

The Examiner has failed to identify which, if any, claims actually fall into the group that stands rejected. Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected." This rule requires that the Examiner at a minimum identify the claims subject to each ground of rejection.

When rejecting any claim, the Examiner is required to state the reason for such rejection. 35 U.S.C. § 132. Section 132 is violated when a rejection is so uninformative that it prevents the applicant from recognizing and seeking to counter the grounds for rejection. *Chester v. Miller*, 906 F.2d 1574, 1578, 15 U.S.P.Q.2d 1333, 1337 (Fed. Cir. 1990). Under 37 C.F.R. § 1.104(c), "If the invention is not considered patentable, or not considered patentable as claimed, the claims, or those considered unpatentable will be rejected. . . . The pertinence of each reference, if not apparent, must be clearly explained and *each rejected claim specified*." (emphasis added) Section 707.07(i) of the M.P.E.P. sets forth, "In every letter, each pending claim should be mentioned by number, and its treatment or status given." Accordingly, to state a valid rejection the Examiner must, at a minimum, specify by number the claims subject to each ground of rejection. The failure of the Examiner to identify by number the claims that may stand rejected results in a statement that is so uninformative that it prevents Applicants from recognizing and seeking to counter the grounds for rejection. As the purported rejection fails to identify the claims rejected by number, the purported rejection fails to comply with the requirements of 35 U.S.C. § 132, 37 C.F.R. § 1.104(c) and M.P.E.P § 707.07(i).

The Examiner has failed to provide information on which a *prima facie* case of obviousness could be based under 35 U.S.C. § 103(a).

Under § 103, the scope and content of the prior art are to be determined; differences between the prior art and the claims at issue are to be ascertained; and the level of ordinary skill in the pertinent art resolved. Against this background, the obviousness or nonobviousness of the subject matter is determined.

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459, 467 (1966).

The Examiner has utterly failed to conduct the second inquiry set forth in *Graham v. Deere*. The Office Action includes no inquiry into the differences between the prior art and the claims at issue. "Ascertaining the differences between the prior art and the claims at issue requires interpreting the claim language." M.P.E.P. § 2141.02. The Examiner makes no attempt to interpret the claim language. The Examiner makes no attempt to determine whether *the pending claims* are obvious in view of the cited prior art. Rather, the Examiner merely asserts what he feels the applied references teach. The Office Action includes no showing that applied references teach all of the limitations of any of the pending claims. Thus, the Office Action provides insufficient information on which to base a *prima facie* case of obviousness.

Applicants respectfully submit that, notwithstanding the accuracy of the Examiner's characterization of the applied references or applicability of any of these references against the pending claims, for the above reasons the Office Action fails to state a *prima facie* case of obviousness. Therefore, Applicants respectfully request that this rejection under 35 U.S.C. § 103(a) be withdrawn.

I. Response to Examiner's Administrative Requirement

Applicants respectfully traverse the requirements imposed by the Examiner in the Office Action at page 169.

The Examiner requires Applicants to either:

- (1) file terminal disclaimers in each of the related 329 applications terminally disclaiming each of the other 329 applications; or
- (2) provide an affidavit attesting to the fact that all claims in the 329 applications have been reviewed by applicant and that no conflicting claims exist between the applications; or
- (3) resolve all conflicts between claims in the related 329 applications by identifying how all the claims in the instant application are distinct and separate inventions from all the claims in the above identified 329 applications.

In addition, Examiner states that failure to comply with any one of these requirements will result in abandonment of the application.

Applicants traverse this requirement for the reasons stated in Section II C of the Amendment and Request for Reconsideration filed September 18, 1998 in application number 08/470,571. Further, Applicants have fully responded to the re-imposition of this requirement in the Petition To The Commissioner Under 37 C.F.R. § 1.181 filed March 7, 2000, which requests, *inter alia*, that this improper requirement be withdrawn.

J. Response to Obviousness-Type Double Patenting Rejection

Applicants respectfully request that the Examiner reconsider and withdraw his rejection based on obviousness-type double patenting on two separate grounds.

1. The Examiner has totally confused and misapplied the established law of double patenting and, further, has failed to follow the mandates of the Manual of Patent Examining Procedure as to double patenting rejections.

2. The Examiner has also failed to analyze the pending claims on a limitation-by-limitation basis to demonstrate that no patentable distinctions exist between the pending claims and those in the issued Harvey patents.

1. PTO Assertions in Office Action mailed January 7, 2000

The Examiner has rejected claims 1-399 of the application under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-13 of U.S. Patent No. 4,684,490 (Harvey I); claims 1-5 of U.S. Patent No. 4,704,725 (Harvey II); claims 1-25 of U.S. Patent No. 4,965,825 (Harvey III); claims 1-26 of U.S. Patent No. 5,109,414 (Harvey IV); claims 1-71 of U.S. Patent No. 5,233,654 (Harvey V); and claims 1-56 of U.S. Patent No. 5,335,277 (Harvey VI), in view of at least one or more of a list of over 30 prior art references from pages 170-179.

In the Office Action at page 180, the Examiner rejects 1-399 under obviousness-type double patenting as being unpatentable over any single claim or combination of claims are “no more than an obvious variation of the patented claims when the teachings discussed throughout this action are considered.” (Office Action at 180.) The Examiner attempts to assert a catch-all rejection by incorporating all arguments and allegations discussed throughout the pages of the Office Action. Again, the Examiner provides no authority for this sweeping new ground for rejecting claims under obviousness-type double patenting.

The Examiner’s application of obviousness-type double patenting standard represents an erroneous and misapplied interpretation of existing case law and is contrary to patent examining procedure. First, the Examiner has confused and misapplied the established law of double patenting and has failed to follow the mandates of the M.P.E.P. as to double patenting rejections. Secondly, the Examiner has also failed to analyze the pending claims on a limitation-by-limitation basis to demonstrate that no patentable distinctions exist between the pending claimed and those issued in the Harvey patents as required by the M.P.E.P.

Based on the following discussion, Applicants respectfully request the withdrawal of these rejections.

2. The Scope of the Double Patenting Doctrine

The prohibition against double patenting is a judicial doctrine based on the language of 35 U.S.C. § 101, which specifies that an inventor who invents “any new and useful process, machine, manufacture, or composition of matter...may obtain a patent therefor.” In *Miller*¹, the U.S. Supreme Court held the term “a patent” to mean, “two valid patents for the same invention cannot be granted either to the same or to a different party.”² Therefore, the claims in a second patent must be patentably distinct from the claims in a first patent or the second patent would be an improper extension of the first.

As the preclusion is to obtaining two patents on the same invention or an obvious modification of the same invention, the sole question is whether by examining the scope of the claims, one has attempted to claim the same subject matter twice, or an obvious variation. No prohibition exists against a second patent on subject matter that is disclosed but not claimed in the first patent.

Under 35 U.S.C. § 120, a patent applicant may submit additional claims in a subsequent application which are supported by the disclosure in the original applications’ specification. A proper continuation application and its original application are considered “parts of the same transaction, and both as constituting one continuous application, within the meaning of the law.”³ Furthermore, 35 U.S.C. § 120 does not place a definite time limit on filing a continuing application. Rather, all that is required to preserve an earlier effective filing date as to common subject matter is copendency or a continuous chain of copendency.

The double patenting doctrine prevents an extension of a patent term which would occur if successive patents were allowed on the same invention or obvious variants.

¹ *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894).

² *Id.* at 197.

³ *In re Hogan*, 449 F.2d 595, 603 (CCPA 1977)(quoting *Godfrey v. Earnes*, 68 U.S. 317, 325-6 (1864)).

However, if two patents contain the same disclosure, but claim different inventions or nonobvious variations, double patenting does not exist.

3. Patent Office Procedure

The U.S. Patent and Trademark Office (“PTO”) has specified a procedure in the Manual of Patent Examining Procedure (M.P.E.P.) for Examiners to follow in establishing a *prime facie* case of double patenting. In determining whether a proper basis exists for a double patenting rejection, the Examiner must determine whether:

1. A double patenting rejection is prohibited by the third sentence of 35 U.S.C. § 121 related to divisional applications,
2. A statutory basis exists (i.e., whether same-invention double patenting is present), or
3. A non-statutory basis exists (i.e., whether obviousness-type double patenting is present).⁴

Assuming the application is not a divisional application, the Examiner must establish in step 2 that the same invention is being claimed twice. The Court specified in *In re Vogel*, 422 F.2d 438, 164 U.S.P.Q. 619 (C.C.P.A. 1970), that in determining same-invention double patenting analysis, one must ask “is the same invention being claimed twice?...[The] “invention” here means what is defined by the claims, whether new or old, obvious or unobvious....By the “same invention” we mean identical subject matter.”⁵ The court stated “that claims may be differently worded and still define the same invention.”⁶ In conclusion, the court found “the only objective test” for same-invention double patenting as,

⁴ M.P.E.P. § 804.

⁵ *In re Vogel*, 422 F.2d at 441.

⁶ *Id.*

whether one of the claims could be literally infringed without literally infringing the other. If it could be, the claims do not define identically the same invention.⁷

If there is no same-invention double patenting, then the Examiner must establish in step 3 obviousness-type double patenting wherein the grant of a patent with the claims in the application would unjustly extend the rights granted by the first patent.

4. Nonstatutory Double Patenting

In defining nonstatutory double patenting, the M.P.E.P. provides three types of nonstatutory-type double patenting based on the judicial doctrine, which include one-way obviousness, two-way obviousness⁸, and nonobviousness rejections.⁹

Under the M.P.E.P. requirements, if the application at issue is the later filed application, only a one-way determination of obviousness is needed to resolve the issue of double patenting. The issue to be determined is whether the invention defined in a claim in the application is an obvious variation of the invention defined in a claim of the patent. *See, e.g., In re Berg*, 46 U.S.P.Q.2d 1226 (Fed. Cir. 1998). The M.P.E.P. mandates that unless a claimed invention in the application is obvious over a claimed invention in the patent, an Examiner should make no double patenting rejection of the obviousness-type. Thus, the sole issue is the scope of the inventions as defined by the claim language in the patent and later filed application.

⁷ *Id.*

⁸ A two-way obviousness double patenting rejection arises in the specific instance where the claims of a patent application are being compared with the claims of a later filed but earlier issued patent. This is not the case with respect to the present double patenting rejection.

⁹ M.P.E.P. § 804. Nonobviousness-type double patenting rejections arise in circumstances as described in *In re Schneller*, 397 F.2d 350, 158 USPQ 210 (CCPA 1968). With respect to the instant application, a nonobviousness-type double patenting rejection was made on February 6, 1997, and withdrawn in the Office Action mailed on March 31, 1998.

a) **Standard for Determining One-Way Obviousness-Type
Double Patenting**

*In re Kaplan*¹⁰, the Federal Circuit specified that an obviousness-type double patenting rejection rests on the prohibition against issuance of a second patent that would continue protection, beyond the expiration date of the first patent, or a mere variation of the previous patented invention that would have been obvious to those of ordinary skill in the relevant art.

Thus, in establishing a *prima facie* case of obviousness-type double patenting, the Examiner must,

1. Identify the inventions claimed in the claims under consideration and in the patent claims,
2. Establish that any variation(s) between the inventions claimed in the claims under consideration and the earlier-issued patent claims would have been obvious to person of ordinary skill in the art, and
3. Establish a *prima facie* case of obviousness.¹¹

To summarize, the Examiner must show that (1) the inventions claimed (2) are not patentably distinct based on (3) a *prima facie* showing of obviousness. Instead, the Examiner has provided bald statements that obvious variations exist. The mere finding that the claims themselves are obvious variations, without establishing that the alleged variations would have been obvious, cannot properly support an obviousness-type double patenting rejection.

In the Office Action under paragraphs 22-23, the Examiner has failed to establish a *prima facie* showing of obviousness-type double patenting in the rejection of 1-399. In particular, the Examiner has not identified the scope of the inventions of the instant

¹⁰ *In re Kaplan*, 789 F.2d 1574, 229 USPQ 678 (Fed. Cir. 1986).

¹¹ See *In re Longi*, 759 F.2d 887, 225 USPQ 645, 651 (Fed. Cir. 1985) (Examiner must provide *prima facie* case of obviousness for obviousness-type double patenting rejection. The burden then shifts to the Applicant to rebut the *prima facie* case).

application and the patents as determined by the claims. Secondly, the Examiner has not positively identified any variations in the claims of the instant application and the claims of the patent. Examiner has provided broad allegations that obvious variants exist, but fail to specifically state these allegedly obvious variants. Thirdly, the Examiner has not shown a *prima facie* case of obviousness under the requirements of 35 U.S.C. § 103. The Examiner has not indicated proper motivation in making the alleged obvious modifications. Since no motivation is provided, it may follow that the variations are not obvious. Moreover, monopolies would not be extended on the same claimed invention.

(1) Identifying the Inventions Claimed

(a) Scope of the Inventions as Defined by the Claim Language

The C.C.P.A. in *In re Vogel*¹² summarized this step by asking, “does any claim in the application define merely an obvious variation of an invention disclosed and claimed in the patent?”¹³ The analysis is based on what the claim defines, and not merely the claim language itself. This first step in the analysis should not focus on what the claim language *discloses*, but on rather what the claim language *defines*.¹⁴ As noted by the Federal Circuit,

it is important to bear in mind that comparison can be made only with what invention is *claimed* in the earlier patent, paying careful attention to the rules of claim interpretation to determine what invention a claim *defines* and not looking to the claim for anything that happens to be mentioned in it *as though it were a prior art reference*.¹⁵

...

¹² *In re Vogel*, 422 F.2d 438, 164 USPQ 619.

¹³ *Id.*, 164 USPQ at 622.

¹⁴ *General Foods Corp. v. Studiengesellschaft Kohle mbh*, 972 F.2d 1272, 23 USPQ 1893, 1845 (Fed. Cir. 1992).

¹⁵ *Id.*, 972 F.2d at 1280.

[T]he fundamental rule of claim construction, that what is claimed is what is *defined by the claim taken as a whole*, every claim limitation...being material¹⁶

...

[P]atent claims are looked to only see what *has been patented*, the subject matter which *has been protected*, not for something one may find to be disclosed by reading them¹⁷

Rather than identifying the scope of the inventions as defined by the claims, the Examiner has assumed an obviousness-type double rejection based on two claims in separate applications supported by the same embodiment of the applications' common specification, as set forth in paragraph 23. The basis for the Examiner's obviousness-type double patenting rejection is premised on a common embodiment. There is no statutory basis for this improper interpretation of obviousness-type double patenting.

The Examiner's "same embodiment" basis for obviousness-type double patenting is erroneous for at least the following reasons. First, two claims in two separate applications may find support in the same embodiment while claiming inventions that are patently distinct. An embodiment as described by a common specification and drawings may fully disclose a wide range of details and limitations. However, it may not follow that separate claims, which are supported by a common embodiment, are also identical in scope, as assumed by the Examiner. Second, by relying on a common embodiment, the Examiner has improperly treated the specification as prior art. Finding a claimed invention to be an obvious variation of patented claims by treating the patent disclosure

¹⁶ *Id.*

¹⁷ *Id.* citing *In re Aldrich*, 398 F.2d 855, 859, 158 USPQ 311, 314 (CCPA 1968).

as though it is prior art has been repeatedly held as impermissible.¹⁸ The use of an applicant's invention disclosure as prior art against him is improper.¹⁹ By broadly rejecting pending claims under obviousness-type double patenting without analyzing the claims of the inventions, the Examiner has misapplied and confused the law of obviousness-type double patenting.

(b) Proper Use of Specification

Because the obviousness-type double patenting rejection requires claim interpretation, the Examiner may use the specification in a limited capacity to assist in interpreting what the claim language defines. The patent disclosure cannot be used as prior art, but the disclosure can be used to (1) determine the meaning of terms in a claim and may also be used as required to (2) answer the above question, "whether the claim in the application defines merely an obvious variation of the invention disclosed and claimed in the patent."²⁰ With respect to "the invention disclosed and claimed in the patent," the Federal Circuit stated in *Vogel*,

We recognize that it is difficult, if not meaningless, to try to say what is or is not an obvious variation of a claim. A claim is a group of words defining only the boundary of the patent monopoly....The disclosure, however, sets forth at least one tangible embodiment within the claim, and it is less difficult and more meaningful to judge whether that thing has been modified in an obvious manner. It must be noted that this use of the disclosure is not in contravention of the cases forbidding its use as prior art, nor is it applying the patent as a reference under 35 U.S.C. § 103, since only the disclosure of the invention claimed in the patent may be examined.²¹

¹⁸ *In re Kaplan*, 229 USPQ at 683.

¹⁹ *Id.*

²⁰ *In re Vogel*, 422 F.2d at 441.

²¹ *Id.*, 422 F.2d at 442.

Therefore, it is proper to identify the invention claimed in the patent by using *exclusively only the portion(s) of the disclosure supporting the claimed invention.*

Alternately, it is improper to make a double patenting rejection when the rejection relies on specification support other than the specific portion(s) of the disclosure supporting the claimed invention.

It has been repeatedly held that use of disclosure of a patent cited in support of a double patenting rejection cannot be used as through it were prior art, even where the disclosure is found in the claims. *See, e.g., Braat*, 937 F.2d at 594 n.5, 19 U.S.P.Q. at 1293 n.5 (“The patent disclosure must not be used as prior art”); *Vogel*, 422 F.2d at 442, 164 USPQ at 622 (in considering obviousness-type double patenting, “the patent disclosure may not be used as prior art”); *In re Plank*, 399 F.2d 241, 242, 158 U.S.P.Q. 328, 329 (C.C.P.A. 1968) (“Its claims are used as the basis for a double patenting rejection. It is not a prior art reference”); *In re Aldrich*, 398 F.2d 855, 859, 158 U.S.P.Q. 311, 314 (C.C.P.A. 1968) (“[P]atent claims are looked to only to see what has been patented, the subject matter which has been protected, not for something one may find to be disclosed by reading them.”)

In the instant case, the Examiner has improperly relied on the specification in making the obviousness-type double patenting rejection. Whether support is provided for the claim language is an issue separate from the scope of the claims in the determination of a double patenting rejection. The Examiner has confused the issue of claim support with the issue of claim interpretation in determining whether obviousness-type double patenting exists. Claim interpretation is limited to what the claim language defines as the

scope of the invention. By doing so, the Examiner has relied on specification support other than the specific portions of the disclosure supporting the claimed invention. Applicants have failed to follow the mandates as expressed in the M.P.E.P. thereby failing to establish a *prima facie* case of double patenting of the obviousness-type.

According to *In re Vogel*, one must first “determine how much of the patent disclosure pertains to the invention claimed in the patent” because only “[t]his portion of the specification supports the patent claims and may be considered.” The Examiner has disregarded this critical step in his analysis of the obviousness-type double patenting rejection.

(c) Best Mode

The scope of the invention is determined by the claim language. The best mode disclosed in the specification as interpreted by the Examiner does not define the boundaries of the claims when determining double patenting of the obviousness-type. Examiner has again improperly relied on the specification to interpret the scope of the invention while failing to analyze the pending claims on a limitation-by-limitation basis to demonstrate that no patentable distinctions exist between the pending claims and those in the issued Harvey patents.

In *In re Schneller*, 397 F.2d 350, 158 U.S.P.Q. 210 (C.C.P.A. 1968), the Schneller patent disclosed elements A, B, C, X, and Y as the best mode and claimed A, B, C, and X which covered other features incorporated in the claim because of the term “comprising”, thus effectively covering the combination A, B, C, X, and Y. The later filed application claimed elements A, B, C, and Y and elements A, B, C, X, and Y. Thus, making the new combination would merely exercise skill or ingenuity expected of a person with ordinary skill in the art because X and Y were both known in the art.

The court in *In re Schneller* noted the uniqueness of the factual circumstances surrounding the element composition of the application which involved the substitution of element X for element Y, rather than the addition or subtraction of an element from the patent's claims.²² The court went on to state that "[this] is not a case of an improvement or modification invented after filing . . . Hence it is not the usual 'obviousness-type' double patenting case."²³ Thus, the court limited the applicability of this holding. The Examiner has not offered any proof that *Schneller*'s use of the disclosed best mode may be properly applied to the facts of the instant application. More specifically, the instant case does not involve the substitution of one element (X) for another element (Y) where the rest of the claimed subject matter (ABC) is well known and where the two elements (X and Y) are also known in the art.

While *In re Schneller* relied on a disclosed best mode of ABCXY in finding a non-statutory double patenting rejection, the Examiner's use of a best mode to find all variations obvious is unwarranted. An allegation of an improper extension of a unified system monopoly cannot be supported without examining the scope of the claims. In *In re Schneller*, the court specifically cited and analyzed both the claims in the patent and the elements in the claims in the *Schneller* application. The court then clearly demonstrated how the claims in the patent read on the claims in the application to support the double patenting rejection. The Office Action fails to provide such an analysis.

(d) Means Plus Function

In interpreting "means plus function" language, the Federal Circuit held *In re Lonardo*, 119 F.3d 960, 43 U.S.P.Q.2d 1262 (Fed. Cir. 1997) that under 35 U.S.C. § 112, sixth paragraph²⁴, correct interpretation of the means plus function element must be in

²² 397 F.2d at 353-54.

²³ *Id.*

²⁴ See *In re Donaldson*, 16 F.3d 1189, 1193, 29 USPQ2d 1845, 1849 (Fed. Cir. 1994).

light of the disclosed structure for implementing the function, and in a manner that is expressly recited in the claim.²⁵ The PTO must apply 35 U.S.C. §112, sixth paragraph, in appropriate cases, and give claims their broadest reasonable interpretation in light of and consistent with the written description of the invention in the application.²⁶

**(2) Establishing Variations between the Invention Claimed
and the Invention Defined in the Patent Claims**

Based on the proper identification of each of the inventions, *supra*, the Examiner then must identify the variation(s) between the inventions being claimed in the application and the invention as defined by the claims in the patent.

As discussed above, the Examiner has not properly identified the inventions. In fact, the Examiner has failed to analyze and interpret the claims on a limitation-by-limitation basis to demonstrate that no patentable distinctions exist between the pending claims and those in the issued Harvey patents. Rather, in an attempt to address the variations between the inventions, the Examiner provides broad allegations that “no pending claim is more than an obvious variation...” (Office Action at 180.) However, the Examiner has failed to specifically identify these variations. Such blanket assertions do not fulfill the requirement of identifying variations between the invention claimed and the invention defined by the patent claims, as mandated by the M.P.E.P.

As to paragraph 23, the Examiner presents a weak attempt at establishing variations between the invention claimed and the invention defined in the patent claims. More specifically, the Examiner states that “[t]he differences are suggested ... by the art above.” (Office Action at 180.) The Examiner erroneously believes that incorporating any differences merely **suggested** (and not necessarily explicitly stated) by any and all prior art discussed throughout entire Office Action is proper. The Examiner is required to

²⁵ *In re Lonardo*, 43 USPQ2d at 1267.

²⁶ *In re Donaldson*, 16 F.3d at 1194.

identify the variations between the inventions being claimed and the invention as defined by the patent claims. Placing the burden on Applicants to sift through the Office Action to locate any and all discussions of the differences suggested, explicitly and/or implicitly, by the prior art is contrary to law. There is no statutory basis for Examiner's version of identifying variations between the sets of claims at issue.

Applicants provide Appendix B herewith, which identify Applicants' patentable subject matter of the instant claims over specific Applicants' patented claims in response to Appendix A of the Office Action.

(3) Variations Would Have Been Obvious to a Person of Ordinary Skill in the Art

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 U.S.P.Q. 459 (1966) that establish a background for determining obviousness under 35 U.S.C. § 103 are employed when making an obviousness-type double patenting analysis. However, the "patent principally underlying the double patenting rejection is not considered prior art."²⁷ The factual inquiries are summarized as follows:

- (A) Determine the scope and content of the patent claim and the prior art relative to the claim in the application at issue;
- (B) Determine the differences between the scope and content of the patent claim and the prior art as determined in (A) and the claim in the application at issue;
- (C) Determine the level of ordinary skill in the pertinent art; and
- (D) Evaluate any objective indicia of nonobviousness.²⁸

Additionally, the Federal Circuit held in *Kaplan* that obviousness-type double patenting rejections must include clear evidence to establish why an alleged variation of an invention claimed in a prior patent would have been obvious.

²⁷ *In re Longi*, 759 F.2d at 892, n.4 (citing *In re Braithwaite*, 379 F.2d 594, 600 n.4, 54 CCPA 1589, 154 USPQ 29 (CCPA 1967)).

²⁸ M.P.E.P. § 804 (II) B (1).

[T]here must be some clear evidence to establish why the variation would have been obvious which can properly qualify as “prior art.” Even if obviousness of the variation is predicated on the level of skill in the art, prior art evidence is needed to show what the level of skill was.²⁹

Otherwise, if no clear prior art evidence establishes that the variation(s) in the application claims are obvious over the invention defined by the claims of the patent, one can assume that the characteristic of the claims including the variation(s),

appear that the invention covered by the later patent was a separate invention, distinctly different and independent from that covered by the first patent; in other words, it must be something substantially different from that comprehended in the first patent. It must consist in something more than a mere distinction of the breadth or scope of the claims of each patent.³⁰

As discussed above, the Examiner has failed to properly identify the inventions as claimed and has further failed to identify the variations as required for a proper obviousness-type double patenting rejection. Nonstatutory double patenting is intended to prevent prolongation of the patent term by prohibiting the extension of patent monopolies in successive patents. While the prohibition of extending patent monopolies is a policy concern, a statement of motivation for establishing obviousness under 35 U.S.C. § 103 is nevertheless lacking. Because Examiner has not provided any evidence that establishes that the variations are obvious over the invention as defined by the claims, the claims of the instant application may be assumed to be a separate and distinct invention.

Under paragraph 30, in an attempt to address the obviousness of the variations, the Examiner states that “[t]he provision of any such differences would have been obvious for the benefit of providing greater functionality to the user” (Office Action at

²⁹ *Id.* at 683.

³⁰ *Miller v. Eagle Mfg. Co.*, 151 U.S. at 198.

144.) The Examiner provides a single statement of motivation to address any differences without positively identifying the differences.

This statement lacks the proper motivation for establishing obviousness under 35 U.S.C. § 103 for at least the following reasons. First, “for the benefit of providing greater functionality to the user” does not answer the question of whether the differences would have been obvious to one of ordinary skill in the art. This attempt at providing motivation fails to take into consideration the level of ordinary skill at the time of the invention. To determine whether greater functionality provides adequate motivation, the Examiner should take into consideration (among other things) the level of ordinary skill in the art, as expressly provided in M.P.E.P § 804 (II)B(1) and *Graham v. John Deere Co.*³¹ A proper motivation statement takes into consideration what would have been obvious to someone with ordinary skill in the art at the time of the invention. Without this determination, a modification cannot be deemed obvious for “greater functionality”. Examiner attempts to provide the level of ordinary skill in the art on pages 123-128. However, the Examiner nevertheless fails to provide a teaching as to how the differences would have been obvious. A variation may not be assumed to be obvious merely because greater functionality is alleged to be provided. The Examiner has failed to provide a proper statement of motivation.

Second, Examiner’s statement of motivation is overly broad. The statement of “greater functionality to the user” does not adequately provide a teaching to one of ordinary skill in the art. According to the Examiner’s reasoning, any and all differences between sets of claims, whether novel or not, will be considered obvious due to “greater functionality”. The Examiner’s version of motivation is improper and erroneous.

Third, while a variation provides “greater functionality”, it may also be considered novel and non-obvious. For example, while an improvement on a widget

³¹ 383 U.S.1, 148 USPQ 459 (1966).

provides "greater functionality", the improvement may just as well be novel and therefore merit patent protection. Non-obvious improvements provide "greater functionality" to the user. Likewise, a mere change in color may also provide greater functionality to the user. However, based on the level of ordinary skill in the art at the time of the invention, a mere color change may be considered to be an obvious variation. Because Examiner's version of motivation may be construed in two dynamically different ways, the motivation statement of providing "greater functionality to the user", as applied to "any such differences" is clearly deficient.

5. Conclusion

The Examiner's basis for the double patenting rejections is inconsistent with the Patent Office Procedures found in the M.P.E.P. The Examiner has fatally misapplied and confused the established law of double patenting. The belief that if two claims in separate applications are supported by the same embodiment in the application's common specification as being a *prima facie* basis for obviousness-type double patenting rejections is not supported by the rules and procedures as set forth in the M.P.E.P. Furthermore, the Examiner has not cited any case law or any other authority, for that matter, for this erroneous basis.

To establish a proper obviousness-type double patenting rejection, the PTO must show that (1) the inventions claimed (2) are not patentably distinct and (3) are based on a *prima facie* showing of obviousness. According to § 804 of the M.P.E.P., any obviousness-type double patenting rejection should make clear the differences between the inventions defined by the conflicting claims; and the reasons why a person of ordinary skill in the art would conclude that the invention defined in the claim in issue is an obvious variation of the invention defined in a claim in the patent. As discussed above,

the Examiner has not identified the claimed inventions; established variations; or shown that variations would have been obvious to a person of ordinary skill in the art.

Therefore, the Examiner has failed to properly establish a *prima facie* basis for a double patenting rejection of the obviousness type. Applicants respectfully request withdrawal of the rejection of all pending claims.

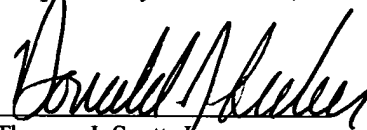

III. CONCLUSION

In accordance with the foregoing it is respectfully submitted that all outstanding objections and rejections have been overcome and/or rendered moot. Further, all pending claims are patentably distinguishable over the prior art of record, taken in any proper combination. Thus, there being no further outstanding objections or rejections, the application is submitted as being in a condition for allowance, which action is earnestly solicited.

If the Examiner has any remaining informalities to be addressed, it is believed that prosecution can be expedited by the Examiner contacting the undersigned attorney for a telephone interview to discuss resolution of such informalities.

66. A method of processing signals at a receiver station comprising the steps of:	Column 10 lines 24-39.	FIGS. 3A, 3B and 3C illustrates one instance of such use. FIGS. 3A, 3B and 3C illustrates the use of Signal Processing Apparatus and Methods at a cable television system "head end" transmission facility that cablecasts several channels of television programming. The means for and method of transmission of programming described here is well known in the art. The facility receives programming from many sources. Transmissions may be received from satellites by satellite antenna, 50, low noise amplifiers, 51 and 52, and TV receivers, 53, 54, 55, and 56. Microwave transmissions are received by microwave antenna, 57, and television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions are received by antenna, 60, and TV demodulator, 61. Other electronic programming input means, 62, can receive programming transmissions.	Page 324 lines 18-31.	Fig. 6 illustrates Signal Processing Apparatus and Methods at an intermediate transmission station that is a cable television system "head end" and that cablecasts several channels of television programming. The means and methods for transmitting conventional programming are well known in the art. The station receives programming from many sources. Transmissions are received from a satellite by satellite antenna, 50, low noise amplifiers, 51 and 52, and TV receivers, 53, 54, 55, and 56. Microwave transmissions are received by microwave antenna, 57, and television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions are received by antenna, 60, and TV demodulator, 61. Other electronic programming transmissions are received by other programming input means, 62.
receiving one of a broadcast and cablecast transmission;	Column 10 lines 30-39.	The facility receives programming from many sources. Transmissions may be received from satellites by satellite antenna, 50, low noise amplifiers, 51 and 52, and TV receivers, 53, 54, 55, and 56. Microwave transmissions can be received by microwave antenna, 57, and television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions can be received by antenna, 60, and TV demodulator, 61. Other electronic programming input means, 62, can receive programming transmissions.	Page 324 lines 23-31.	The station receives programming from many sources. In this fashion, computer, 73, causes units Y and W to be located on different recorders because said units are scheduled to be transmitted simultaneously and units Y then D to be located in sequence on the same recorder because unit D is scheduled to play on the same channel immediately after Y. The present invention employs signals embedded in programming. Embedded signals provide several advantages. They cannot become separated inadvertently from the programming and, thereby, inhibit automatic processing. They occur at precise times in programming and can synchronize the operation of receiver station apparatus to the timing of programming transmissions. They can be conveniently monitored.
	Column 4 lines 5-13.	These techniques employ signals embedded in programs. The advantage of such embedded signals, as compared to header and trailer signals, is that they cannot become separated inadvertently from the programming and, thereby, inhibit automatic processing, , that they can convey signals to equipment that must switch manners or modes of operation during transmissions of individual units of programming, and that they can be monitored.	For example, page 333 lines 15-21. For example, page 334 lines 1-6. Page 13 lines 25-32.

inputting an instruct signal which is effective at said subscriber station	Column 19 lines 63 to column 20 line 2.	This signal is identified by decoder, 203, and transferred via processor, 204, to microcomputer, 205. This signal instructs microcomputer, 205, to transmit the first overlay to TV set, 202, for as long as it receives the same instruction signal from processor, 204. The viewer then sees a microcomputer generated graphic of his own stocks' performance overlay the studio generated graphic.	telephone connection, 22, which causes said connection, 22, to transmit said records and information to said first computer.
			Said signal is identified by decoder, 203; transferred to microcomputer, 205; and executed ...
			In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed to process said information automatically. Controller, 39, is preprogrammed to discard received duplicate, incomplete, or irrelevant information; to correct errors in retained received information by means of forward error correction techniques well known in the art; to convert, as may be required, the corrected information, by means of input protocol techniques well known in the art, into digital information that subscriber station apparatus can receive and process; to modify selectively particular corrected and converted information in a predetermined fashion or fashions; to identify in a predetermined fashion or fashions subscriber station apparatus to which said signal information should be transferred; and to transfer said signals to said apparatus.
			Said signal instructs microcomputer, 205, at the PC-MicroKey 1300 to overlay the graphic information in its graphics card onto the received composite video information and transmit the combined information to TV monitor, 202M. TV monitor, 202M, then displays the image shown in Fig. 1C which is the microcomputer generated graphic of the subscriber's own portfolio performance overlaid on the studio generated graphic.

FIGS. 3A, 3B, and 3C illustrate the use of Signal Processing Apparatus and Methods at a cable television system "head end" transmission facility that cablecasts several channels of television programming. ... if controller/computer, 73, determines that programming incoming via receiver, 53, should be transmitted immediately to the field distribution system, 93, via cable channel modulator, 87, controller/computer, 73, instructs matrix switch, 75, to configure its switches so as to transfer programming transmissions inputted from TV receiver, 53, to the output that leads to modulator, 87.	Page 328 line 22 to page 329 line 1.	For example, computer, 73, receives a given SPAM message that contains given "program unit identification code" information and the added source mark information of said message identifies distribution amplifier, 63. Receiving said message causes computer, 73, to determine, in a predetermined fashion, that said "code" information matches particular preprogrammed schedule information of programming that is scheduled to be retransmitted immediately upon receipt to

to a remote receiver station and		Column 17 lines 47-53.	FIG 6 illustrates one possible configuration of equipment in a home or office or other television and/or radio receiving site. Consideration of FIGS. 6F and 6G is facilitated by consideration, first, of individual examples of the types of co-ordinated presentations that the signal apparatus and methods described here can permit.	Page 390 lines 30-35.	field distribution system, 93, via cable channel modulator, 87. In its preprogrammed fashion, so determining causes computer, 73, to cause matrix switch, 75, to configure its switches so as to transfer the programming transmission inputted (via distribution amplifier, 63) to matrix switch, 75, from TV receiver, 53, to that output of matrix switch, 75, that outputs to modulator, 87.
	controlling said remote receiver station to deliver an individualized mass medium program presentation, said method of controlling comprising the steps of:	Column 19 lines 63 to column 20 line 2.	This signal is identified by decoder, 203, and transferred via processor, 204, to microcomputer, 205. This signal instructs microcomputer, 205, to transmit the first overlay to TV set, 202, for as long as it receives the same instruction signal from processor, 204. The viewer then sees a microcomputer generated graphic of his own stocks' performance overlay the studio generated graphic.	Page 396 lines 8-10. Page 26 lines 1-2. Page 37 line 26 to page 38 line 8.	Fig. 7 exemplifies one embodiment of an ultimate receiver station; is a subscriber station in the field distribution system, 93, of the intermediate transmission station of Fig. 6; and may be a home, an office, a theater, a hotel, or any other station where programming such as television or radio is displayed to persons. Features, benefits, and modes of operation of the station of Fig. 7 are demonstrated in the following individual examples. Said signal is identified by decoder, 203; transferred to microcomputer, 205; and executed ... In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed to process said information automatically. Controller, 39, is preprogrammed to discard received duplicate, incomplete, or irrelevant information; to correct errors in retained received information by means of forward error correction techniques well known in the art; to convert, as may be required, the corrected information, by means of input protocol techniques well known in the art, into digital information that

at least one instruct signal which operates to	Column 20 line 27.	Five minutes later, ...	Five minutes later, said program originating studio embeds in the transmission of the "Exotic Meals of India" programming and transmits a particular first SPAM message ...
select and control communication of one of a code and datum which identifies information contained in said mass medium program;	Column 20 lines 31-36.	This signal instructs buffer/comparator, 8, that, if 567 has been received from signal generator, 225, signal processor, 200, should, in a predetermined fashion, instruct tuner, 223, to tune cable converter box, 222, to the appropriate channel to receive the recipe in encoded digital form ...	A SPAM message is the modality whereby the original transmission station that originates said message controls specific addressed apparatus at subscriber stations. The information of any given SPAM transmission consists of a series or stream of sequentially transmitted SPAM messages.
			One minute later, said program originating studio embeds in the transmission of said "Exotic Meals of India" programming and transmits a particular second SPAM message that consists of an "01" header, particular execution segment information that is identical to said covert control information, appropriate meter-monitor information including unit code identification information that identifies the programming of the information segment of said message, padding bits as required, information segment of particular generate-recipe-and-shopping-list instructions, and an end of file signal.

Column 11 lines 15-17.	Cable program controller and computer, 73, is the central automatic control unit for the transmission facility.	Page 326 lines 19-20.	Cable program controller and computer, 73, is the central automatic control unit for the transmission station.
Column 9 lines 47-57.	The controller, 20, is programmed to sequence the local oscillator, 6, to select each desired frequency for a specific time interval in accordance with a predetermined pattern. This pattern may be selected in accordance with standard broadcast and cablecast practices known to exist on that transmission line or frequency.	Page 248 line 17 to page 249 line 5.	Signal processor, 200, is preprogrammed with information that identifies each cable and over-the-air (hereinafter, "wireless") transmission or frequency in the locality of the subscriber station of Fig. 3 as well as the standard broadcast and cablecast practices that apply on said transmissions and frequencies ... In a predetermined fashion, controller, 20, controls oscillator, 6, to sequence local oscillator, 6, in the pattern: cable channel 2, cable channel 4, cable channel 7, cable channel 13, wireless channel 5, wireless channel 9, wireless channel 13, then to repeat said pattern.
		Page 257 line 24 to page 258 line 19.	Said detection-complete information causes controller, 20, to cause oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 9. Automatically oscillator, 6, causes mixer, 3, to select the frequency of channel 9 and input said frequency of interest, at a fixed frequency, to decoder, 30 ... Controller, 20, has capacity for keeping track of elapsed time, and after determining in a predetermined fashion that a particular predetermined period of time has elapsed from the input of wireless channel 9 to decoder, 30, controller, 20, ... causes oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 13.
	The local oscillator, being thus sequenced, will allow each signal decoder, 30 and 40, to receive a particular frequency at a particular time interval.	Page 257 line 24 to page 258 line 19.	Said detection-complete information causes controller, 20, to cause oscillator, 6, to cause the selection of the next channel in the predetermined television channel selection pattern: wireless channel 13.

Page 324 lines 8-17.	field distribution system, 93, via cable channel modulator, 87. The signal processing apparatus outlined in Figs. 2, 2A, 2B, 2C, and 2D, and their variants as appropriate, can be used to automate the operations of intermediate transmission stations that receive and retransmit programming. The stations so automated may transmit any form of electronically transmitted programming, including television, radio, print, data, and combined medium programming and may range in scale of operation from wireless broadcast stations that transmit a single programming transmission to cable systems that cablecast many channels simultaneously.

		begins at 8:30 PM on a Friday evening, ... several instruction signals are identified by decoder, 203, and transferred to microcomputer, 205.	Page 23 line 35 to page 24 line 4. Page 37 line 26 to page 38 line 8.	begins at 8:30 PM on a Friday evening, ... Subsequently, a second series of instructions is embedded and transmitted at said program originating studio. Said second series is detected and converted into usable digital signals by decoder, 203, and inputted to microcomputer, 205, in the same fashion as the first series. In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed ... to identify in a predetermined fashion or fashions subscriber station apparatus to which said signal information should be transferred; and to transfer said signals to said apparatus.
		These signals instruct microcomputer, 205,	Page 24 lines 5-16.	Microcomputer, 205, evaluates the initial signal word or words which instruct it to load at RAM (from the input buffer to which decoder, 203, inputs) and run the information of a particular set of instructions that follows said word or words just as the information of a file named FILE.EXE, recorded on the contained floppy disk, would be loaded at RAM (from the input buffer to which the disk drive of said disk inputs) and run were the command "FILE" entered from the console keyboard to the system level of the installed disk operating system. (Hereinafter, such a set of instructions that is loaded and run is called a "program instruction set."
		to generate several graphic video overlays,	Page 451 lines 7-11.	...the program instruction set in the first message of the "Wall Street Week" example instructs microcomputer, 205, to generate not one but a plurality overlays. The combining of Fig. 1C is merely the first.

			transmission stations and embedded in television or radio or other programming transmissions monitor information that identifies what programming is available, ... Meter-monitor segments contain meter information and/or monitor information.	
			Page 28 lines 26-27. Page 49 lines 26-27.	
programming said remote intermediate transmitter station to control said at least one of said plurality of selective transfer devices prior to said scheduled time based on said at least one first instruction and said at least one second instruction.	Column 11 lines 21-31. Column 11 lines 57-64.	Such input information might include the cable television system's complete programming schedule, with each discrete unit of programming identified with a unique program code (which in the case of advertising might be a purchase order number). Such input information might also indicate when and where the cable head end facility should expect to receive the programming. Such input information might also indicate when and on which channel or channels the head end facility should transmit each program unit to cable field distribution system, 93. Similarly, if controller/computer, 73, determines that incoming programming should be recorded for delayed transmission, controller/ computer, 73, selects a video recorder/player, 76 or 78, in a predetermined fashion, to record the incoming programming, instructs matrix switch, 75, to transfer the programming to the designated recorder/player, 76 or 78, ...	Page 326 line 30 to page 327 line 2. Page 329 line 2-20.	Such input information can include the complete programming schedule of the station of Fig. 6, with each discrete unit of programming identified by its own "program unit identification code" information. Such input information can indicate when and how the station should expect to receive each program unit, when and on which channel or channels and how the station should transmit the unit, ... Determining that particular incoming programming is scheduled for time deferred transmission can cause computer, 73, to cause the recording of said programming. For example, computer, 73, receives a given SPAM message that contains given "program unit identification code" information and the added source mark information of said message identifies distribution amplifier, 67. Receiving said message causes computer, 73, to determine, in a predetermined fashion, that said "code" information matches particular preprogrammed schedule information of programming that is scheduled to be recorded upon receipt and transmitted to the field system, 93, at a later time. So determining causes computer, 73, in its preprogrammed

Fig. 7C is a block diagram of signal processing apparatus and methods selecting receivable information and programming and controlling combined medium, multi-channel presentations. (To accomplish all this has required only that the subscriber of microcomputer, 205, [and other subscribers at other stations] cause the installation and connection of the apparatus shown in the figures of this submission, especially Fig. 7 (and 7C); caused his microcomputer, 205, to be preprogrammed as described above; and preinformed microcomputer, 205, of his wish to view said "Wall Street Week" program by causing the aforementioned select-WSW information to be recorded at said microcomputer, 205.) Then the combined medium combining process described above in "One Combined Medium" and in examples #1, #2, #3, #4, etc. commences. And the Fig. 1C combining is displayed. But the combining of Fig. 1C is just part of a larger process. When the "Wall Street Week" transmission begins at 8:30 PM on a Friday evening, the program instruction set in the first message of the "Wall Street Week" example instructs microcomputer, 205, to generate not one but a plurality overlays. The combining of Fig. 1C is merely the first. ... caused his microcomputer, 205, to be preprogrammed as described above; ... Microcomputer, 205, is preprogrammed to ... respond ... to instruction signals embedded in the "Wall Street Week" programming transmission.	Page 18 lines 24-27. page 450 line 27 to page 451 line 11.
	Column 19 lines 42-49.	Microcomputer, 205, is preprogrammed to respond in a predetermined fashion to instruction signals embedded in the "Wall Street Week" programing transmission.	Page 450 lines 31-32. Page 21 lines 20-24.

	Column 19 lines 63 to column 20 line 2.	This signal is identified by decoder, 203, and transferred via processor, 204, to microcomputer, 205. This signal instructs microcomputer, 205, to transmit the first overlay to TV set, 202, for as long as it receives the same instruction signal from processor, 204. The viewer then sees a microcomputer generated graphic of his own stocks' performance overlay the studio generated graphic.	Page 26 lines 1-2. Page 37 line 26 to page 38 line 8.	Said signal is identified by decoder, 203; transferred to microcomputer, 205; and executed ... In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43, and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed to process said information automatically. Controller, 39, is preprogrammed to discard received duplicate, incomplete, or irrelevant information; to correct errors in retained received information by means of forward error correction techniques well known in the art; to convert, as may be required, the corrected information, by means of input protocol techniques well known in the art, into digital information that subscriber station apparatus can receive and process; to modify selectively particular corrected and converted information in a predetermined fashion or fashions; to identify in a predetermined fashion or fashions a subscriber station apparatus to which said signal information should be transferred; and to transfer said signals to said apparatus.
			Page 26 lines 4-11.	Said signal instructs microcomputer, 205, at the PC-MicroKey 1300 to overlay the graphic information in its graphics card onto the received composite video information and transmit the combined information to TV monitor, 202M. TV monitor, 202M, then displays the image shown in Fig. 1C which is the microcomputer generated graphic of the subscriber's own portfolio performance overlaid on the studio generated graphic.
			Page 451 line 3.	And the Fig. 1C combining is displayed.

				monitor, 202M.
--	--	--	--	----------------

176. The method of claim 175 wherein said step of generating comprises the step of generating a plurality of user specific graphic overlays representing said performance of said stock or financial portfolio;	Column 19 lines 67 to column 20 line 2.	The viewer then sees a microcomputer generated graphic of his own stocks' performance overlay the studio generated graphic.	Page 451 line 3. Page 26 lines 8-11.	And the Fig. 1C combining is displayed. TV monitor, 202M, then displays the image shown in Fig. 1C which is the microcomputer generated graphic of the subscriber's own portfolio performance overlaid on the studio generated graphic.
	Column 20 lines 5-7.	... and [microcomputer, 205,] prepares to send the next locally generated graphic overlay upon instruction from the originating studio.	Page 27 lines 7-9 and Page 451 line 22 to Page 452 line 5.	Thereafter the "Wall Street Week" program proceeds, and microcomputer, 205, continues to operate under control of received instructions. Furthermore, it is undesirable to separate computer operations merely because they result in the generation of separate overlays because such separation may result in unnecessary duplication of calculations. For example, the Fig. 1C display of user specific overall stock portfolio performance could be followed by second and third displays that analyze portions of the subscriber's portfolio--eg., the portion invested in New York Stock Exchange listed stocks in comparison to the so-called "NYSE" index and the portion invested in so-called "over-the-counter" stocks in comparison to the so-called "NASDAQ" index. In order to calculate the value of the overall portfolio, it is necessary to calculate the value of these portions. To require that the values of these portions be recalculated for subsequent overlays would be inefficient. In computer-based combined medium communications, the amount of information

189. The method of claim 188 further comprising the steps of: determining at least one of the following based on processing said embedded data: (a) when and where to receive said programming identified by said embedded data; and (b) when and over what channel or frequency to communicate said programming; and receiving or communicating said programming identified by said embedded data in accordance with said step of determining.	Column 11 lines 38-57.	By comparing identification signals on the incoming programming with the programming schedule received earlier from local input, 74, and/or from a remote site via network, 98, controller/computer, 73, can determine when and on what channel or channels the head end facility should transmit the programming. Controller/computer, 73, has means for communicating control information with matrix switch, 75, and video recorder/players, 76 and 78. If incoming programming is meant for immediate transmission, controller/computer, 73, instructs matrix switch, 75, to configure its switches so as to transfer incoming programming to the proper output channel. For example, if controller/computer, 73, determines that programming incoming via receiver, 53, should be transmitted immediately to the field distribution system, 93, via cable channel modulator, 87, controller/computer, 73, instructs matrix switch, 75, to configure its switches so as to transfer programming transmissions inputted from TV receiver, 53, to the output that leads to modulator, 87.	Page 327 line 35 to page 328 line 13.	Computer, 73, monitors incoming programming by means of the aforementioned dedicated decoders of signal processor system, 71. By means of the SPAM message information, with source mark information, received from code reader, 72, computer, 73, determines what specific program unit has been received by each receiver, 53 through 62, and is passing in line, via each distribution amplifier, 63 through 70, to matrix switch, 75. By comparing selected meter-monitor information of said message information with information of the programming schedule received earlier from input, 74, and/or network, 98, computer, 73, can determine, in a predetermined fashion, when and on what channel or channels the station of Fig. 6 should transmit the programming of each received program unit. SPAM signals are generated at original transmission stations or intermediate transmission stations and embedded in television or radio or other programming transmissions.... ...monitor information that identifies what programming is available, ... Meter-monitor segments contain meter information and/or monitor information. Computer, 73, has means for communicating control information with matrix switch, 75, and video recorders, 76 and 78, and can cause selected programming to be transmitted to field distribution system, 93, or recorded. Determining that particular incoming programming is scheduled for immediate retransmission can cause computer, 73, to

	Column 12 lines 57-64.	by microwave antenna, 57, and television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions can be received by antenna, 60, and TV demodulator, 61. Other electronic programming input means, 62, can receive programming transmissions.	television video and audio receivers, 58 and 59. Conventional TV broadcast transmissions are received by antenna, 60, and TV demodulator, 61. Other electronic programming transmissions are received by other programming input means, 62.
		This particular embodiment describes a transmission facility transmitting only television programming. The facility could also process and transmit radio programming and other electronic data according to the methods described here by adding radio decoder paths and other signal decoder paths, as shown in FIGS 2B and 2C respectively, to signal processors, 71 and 96, and decoders, 77, 79, 80, 84, and 88.	So far this disclosure has described an intermediate transmission station that transmits conventional television programming; however, the intermediate station automating concepts of the present invention apply to all forms of electronically transmitted programming. The station of Fig. 6 can process and transmit radio programming in the fashions of the above television programming by adding radio transmission and audio recorder/player means, each with associated radio decoder means as shown in Fig. 2B, wherever television means are shown in Fig. 6, all with similar control means to that shown in Fig. 6 and by processing radio programming with appropriately embedded signals according to the same processing and transmitting methods described above. Likewise, said station can transmit broadcast print and data communications programming by adding appropriate transmission and recorder/player means and decoder/detector means with control means and using the same processing and transmitting methods.
demodulating said received signal to detect an information transmission thereon, said information transmission comprising a programming unit of radio or television	Column 11 lines 3-5. detecting said control signal;	Column 19 lines 63-64.	This signal is identified by decoder, 203, and transferred via processor, 204, to microcomputer, 205.	Page 26 lines 1-2. Page 37 line 26 to page 38 line 8.	Said signal is identified by decoder, 203; transferred to microcomputer, 205; and ... In each decoder, the controller, 39, 44, or 47, receives detected digital information from the relevant detector or detectors, 34, 37, 38, 43,

Claim Language	Support to parent application filed November 3, 1981.		Support to instant specification.	
	Reference	Language	Reference	Language

				and 46. Upon receiving any given instance of signal information, controller, 39, 44, or 47, is preprogrammed ... to identify in a predetermined fashion or fashions subscriber station apparatus to which said signal information should be transferred; and to transfer said signals to said apparatus.
displaying said processed information of interest on a television monitor in response to detecting said control signal.	Column 19 lines 67 to column 20 line 2.	The viewer then sees a microcomputer generated graphic of his own stocks' performance overlay the studio generated graphic.	Page 451 line 3. Page 26 lines 8-11.	And the Fig. 1C combining is displayed. TV monitor, 202M, then displays the image shown in Fig. 1C which is the microcomputer generated graphic of the subscriber's own portfolio performance overlaid on the studio generated graphic.

204. The method of claim 202 wherein said step of storing comprises the step of storing the received information of interest with identification information identifying said information of interest, said method further comprising the steps of:	Column 18 lines 65-67. Column 4 lines 5-13.	... and microcomputer, 200, may record the information in memory or transfer it to printer, 221, for printing ... These techniques employ signals embedded in programs. The advantage of such embedded signals, as compared to header and trailer signals, is that they cannot become separated inadvertently from the programming and, thereby, inhibit automatic processing, that they can convey signals to equipment that must switch manners or modes of operation during transmissions of individual units of programming, and that they can be	Page 426 lines 10-18. Page 13 lines 25-32.	Then automatically, microcomputer, 205, transfers said data to said printer, 221. In so doing, microcomputer, 205, causes printer, 221, in a predetermined fashion, to print said AT&T news item. (Said preprogrammed instructions entered by the subscriber might cause said microcomputer, for example, then to establish a programming communication link with computer memory unit, 256, and to cause said unit, 256, to record said AT&T news item.) The present invention employs signals embedded in programming. Embedded signals provide several advantages. They cannot become separated inadvertently from the programming and, thereby, inhibit automatic processing. They occur at precise times in programming and can synchronize the operation of receiver station apparatus to the timing of programming transmissions. They can be conveniently monitored.
